Unit Manufacturing Processes

Unit Manufacturing Processes National Research Council, Division on Engineering and Physical Sciences, Board on Manufacturing and Engineering Design, Commission on Engineering and Technical Systems, Unit Manufacturing Process Research Committee, 1995-02-03 Manufacturing reduced to its simplest form involves the sequencing of product forms through a number of different processes. Each individual step known as a unit manufacturing process can be viewed as the fundamental building block of a nation's manufacturing capability. A committee of the National Research Council has prepared a report to help define national priorities for research in unit processes. It contains an organizing framework for unit process families, criteria for determining the criticality of a process or manufacturing technology, examples of research opportunities and a prioritized list of enabling technologies that can lead to the manufacture of products of superior quality at competitive costs. The study was performed under the sponsorship of the National Science Foundation and the Defense Department's Manufacturing Technology Program. Manufacturing Process Controls for the Industries of the Future National Research Council, Division on Engineering and Physical Sciences, Board on Manufacturing and Engineering Design, National Materials Advisory Board, Commission on Engineering and Technical Systems, Committee on Industrial Technology Assessments, Panel on Manufacturing Process Controls, 1998-08-14 Manufacturing process controls include all systems and software that exert control over production processes. Control systems include process sensors, data processing equipment, actuators, networks to connect equipment and algorithms to relate process variables to product attributes. Since 1995 the U.S. Department of Energy's Office of Industrial Technology's OIT program management strategy has reflected its commitment to increasing and documenting the commercial impact of OIT programs. OIT's management strategy for research and development has been in transition from a technology push strategy to a market pull strategy based on the needs of seven energy and waste intensive industries: steel, forest products, glass, metal casting, aluminum, chemicals and petroleum refining. These industries, designated as Industries of the Future (IOF), are the focus of OIT programs. In 1997 agriculture, specifically renewable bioproducts, was added to the IOF group. The National Research Council Panel on Manufacturing Process Controls is part of the Committee on Industrial Technology Assessments (CITA) which was established to evaluate the OIT program strategy to provide guidance during the transition to the new IOF strategy and to assess the effects of the change in program strategy on cross cutting technology programs that is technologies applicable to several of the IOF industries. The panel was established to identify key processes and needs for improved manufacturing control technology, especially the needs common to several IOF industries, identify specific research opportunities for addressing these common industry needs, suggest criteria for identifying and prioritizing research and development R and recommend means for implementing advances in control technologies. **MANUFACTURING PROCESSES, SECOND EDITION** Kaushish, J. The Unit Manufacturing Process (UMP) Builder

David Lechevalier,2019 The ASTM E3012 Standard Guide for

Characterizing Environmental Aspects of Manufacturing Processes provides guidelines for formally characterizing manufacturing processes. However, the difficulty that has arisen in the early use of the standard illustrates the need for intuitive tools for helping modeling experts to conform to the specified information model. The Unit Manufacturing Process (UMP) Builder was developed at the National Institute of Standards and Technology (NIST) to provide a visual interface for helping modeling experts to conform to the specified ASTM information model. The UMP Builder, a browser-based tool, integrates symbolic mathematical and guided textual inputs helping to consistently record manufacturing process models for environmental sustainability into a repository. The Builder also serves as a curator by providing capabilities to explore and visualize models recorded in the Builder repository. The UMP Builder is adapted from an open source tool called the Configurable Data Curation System (CDCS) developed at NIST. The CDCS was originally developed to capture, share, and transform materials data, allowing users to upload an XML schema and create instances of that schema. In the UMP Builder, the schema used for creating the models is frozen. The schema follows the guidelines from the ASTM E3012 standard. The Builder also provides unique features that are specific in order to facilitate the modeling of UMPs. This user's guide aims to provide guidelines to use the UMP Builder. To obtain more information especially on the architecture, please refer to the CDCS documentation.
