**Latent Variable Analysis and Signal Separation** Emmanuel Vincent, Arie Yeredor, Zbyněk Koldovský, Petr Tichavský, 2015-08-14 This book constitutes the proceedings of the 12th International Conference on Latent Variable Analysis and Signal Separation LVA ICS 2015 held in Liberec Czech Republic in August 2015 The 61 revised full papers presented 29 accepted as oral presentations and 32 accepted as poster presentations were carefully reviewed and selected from numerous submissions Five special topics are addressed tensor based methods for blind signal separation deep neural networks for supervised speech separation enhancement joint analysis of multiple datasets data fusion and related topics advances in nonlinear blind source separation sparse and low rank modeling for acoustic signal processing *Model-Based Signal Processing* James V. Candy, 2005-10-13 A unique treatment of signal processing using a model based perspective Signal processing is primarily aimed at extracting useful information while rejecting the extraneous from noisy data If signal levels are high then basic techniques can be applied However low signal levels require using the underlying physics to correct the problem causing these low levels and extracting the desired information Model based signal processing incorporates the physical phenomena measurements and noise in the form of mathematical models to solve this problem Not only does the approach enable signal processors to work directly in terms of the problem's physics instrumentation and uncertainties but it provides far superior performance over the standard techniques Model based signal processing is both a modeler's as well as a signal processor's tool Model Based Signal Processing develops the model based approach in a unified manner and follows it through the text in the algorithms examples applications and case studies The approach coupled with the hierarchy of physics based models that the author develops including linear as well as nonlinear representations makes it a unique contribution to the field of signal processing The text includes parametric e.g. autoregressive or all pole sinusoidal wave based and state space models as some of the model sets with its focus on how they may be used to solve signal processing problems Special features are provided that assist readers in understanding the material and learning how to apply their new knowledge to solving real life problems Unified treatment of well known signal processing models including physics based model sets Simple applications demonstrate how the model based approach works while detailed case studies demonstrate problem solutions in their entirety from concept to model development through simulation application to real data and detailed performance analysis Summaries provided with each chapter ensure that readers understand the key points needed to move forward in the text as well as MATLAB® Notes that describe the key commands and toolboxes readily available to perform the algorithms discussed References lead to more in depth coverage of specialized topics Problem sets test readers knowledge and help them put their new skills into practice The author demonstrates how the basic idea of model based signal processing is a highly effective and natural way to solve both basic as well as complex processing problems Designed as a graduate level text this book is also essential reading for practicing signal processing professionals and scientists who

will find the variety of case studies to be invaluable An Instructor s Manual presenting detailed solutions to all the problems in the book is available from the Wiley editorial department      Identification and System Parameter Estimation Rolf Isermann,1980      System Identification Torsten Söderström,Petre Stoica,1989 A textbook designed for senior undergraduate and graduate level classroom courses on system identification Examples and problems Annotation copyrighted by Book News Inc Portland OR      *Bio-Inspired Computing and Networking* Yang Xiao,2016-04-19 Seeking new methods to satisfy increasing communication demands researchers continue to find inspiration from the complex systems found in nature From ant inspired allocation to a swarm algorithm derived from honeybees Bio Inspired Computing and Networking explains how the study of biological systems can significantly improve computing networki      Water Resources Engineering William H. G. Childers,1999-09-16 Strike a balance between theory and practice With this text you ll find a balance between theory and practice that allows you to build your understanding of the basic concepts assumptions and limitations of the theory of speech analysis and synthesis The methods for data analysis as well as the theoretical background are provided to help you comprehend the analysis results And you ll be able to study the features and properties of speech as a signal without having to record data and write software to analyze the data The text includes two CDs that contain stand alone and MATLAB software and speech and electroglottographic data The CDs illustrate the effects that speech models and speech analysis procedures have on the quality of synthesized speech An extensive speech database provides numerous speech files and other data Examples included in each chapter demonstrate how to use the software The CDs allow you to Calculate the parameters of linear prediction speech models Examine procedures for converting the speech of one speaker to sound like that of another speaker i e voice conversion Analyze and alter the temporal structure of the speech signal This allows you to automatically parse speech into various features such as voiced segments unvoiced segments nasal and non nasal segments fricatives stops and more Create speech with a high speaking rate or generate speech with a slow speaking rate Adjust the parameters of the vocal fold model to change the vocal fold tension length thickness mass etc in order to observe the effects of these parameters on the vibratory motion of the vocal folds      **Applied Mechanics Reviews** ,1989

**System Identification** Karel J. Keesman, 2011-05-16 System Identification shows the student reader how to approach the system identification problem in a systematic fashion The process is divided into three basic steps experimental design and data collection model structure selection and parameter estimation and model validation each of which is the subject of one or more parts of the text Following an introduction on system theory particularly in relation to model representation and model properties the book contains four parts covering data based identification non parametric methods for use when prior system knowledge is very limited time invariant identification for systems with constant parameters time varying systems identification primarily with recursive estimation techniques and model validation methods A fifth part composed of appendices covers the various aspects of the underlying mathematics needed to begin using the text The book uses essentially semi physical or gray box modeling methods although data based transfer function system descriptions are also introduced The approach is problem based rather than rigorously mathematical The use of finite input output data is demonstrated for frequency and time domain identification in static dynamic linear nonlinear time invariant and time varying systems Simple examples are used to show readers how to perform and emulate the identification steps involved in various control design methods with more complex illustrations derived from real physical chemical and biological applications being used to demonstrate the practical applicability of the methods described End of chapter exercises for which a downloadable instructors Solutions Manual is available from fill in URL here will both help students to assimilate what they have learned and make the book suitable for self tuition by practitioners looking to brush up on modern techniques Graduate and final year undergraduate students will find this text to be a practical and realistic course in system identification that can be used for assessing the processes of a variety of engineering disciplines System Identification will help academic instructors teaching control related to give their students a good understanding of identification methods that can be used in the real world without the encumbrance of undue mathematical detail
