Current Trends in Theoretical Computer Science Gheorghe

Păun, Arto Salomaa, 2001 The scientific developments at the end of the past millennium were dominated by the huge increase

and diversity of disciplines with the common label computer science The theoretical foundations of such disciplines have

become known as theoretical computer science This book highlights some key issues of theoretical computer science as they

seem to us now at the beginning of the new millennium The text is based on columns and tutorials published in the Bulletin of

the European Association for Theoretical Computer Science in the period 1995-2000 The columnists themselves selected the

material they wanted for the book and the editors had a chance to update their work Indeed much of the material presented

here appears in a form quite different from the original Since the presentation of most of the articles is reader friendly and

does not presuppose much knowledge of the area the book constitutes suitable supplementary reading material for various

courses in computer science

Genetic Programming John R. Koza, 1992 In this ground breaking book John Koza shows how

this remarkable paradigm works and provides substantial empirical evidence that solutions to a great variety of problems

from many different fields can be found by genetically breeding populations of computer programs Genetic programming

may be more powerful than neural networks and other machine learning techniques able to solve problems in a wider range

of disciplines In this ground breaking book John Koza shows how this remarkable paradigm works and provides substantial

empirical evidence that solutions to a great variety of problems from many different fields can be found by genetically

breeding populations of computer programs Genetic Programming contains a great many worked examples and includes a

sample computer code that will allow readers to run their own programs In getting computers to solve problems without

being explicitly programmed Koza stresses two points that seemingly different problems from a variety of fields can be

reformulated as problems of program induction and that the recently developed genetic programming paradigm provides a

way to search the space of possible computer programs for a highly fit individual computer program to solve the problems of

program induction Good programs are found by evolving them in a computer against a fitness measure instead of by sitting

down and writing them **Automata, Languages and Programming** Friedhelm Meyer auf der Heide, Burkhard Monien, 1996-06-26 This volume constitutes the refereed proceedings of the 23rd International Colloquium on Automata Languages and Programming ICALP 96 held at Paderborn Germany in July 1996 ICALP is an annual conference sponsored by the European Association on Theoretical Computer Science EATCS The proceedings contain 52 refereed papers selected from 172 submissions and 4 invited papers The papers cover the whole range of theoretical computer science they are organized in sections on Process Theory Fairness Domination and the u Calculus Logic and Algebra Languages and Processes Algebraic Complexity Graph Algorithms Automata Complexity Theory Combinatorics on Words Algorithms Lower Bounds Data Structures

Complexity Theory Lane A. Hemaspaandra, Alan L. Selman, 1997-06-05 This volume provides a survey of the subject in the form of a collection of articles written by experts that together provides a comprehensive guide to research The editors aim has been to provide an accessible description of the current state of complexity theory and to demonstrate the breadth of techniques and results that make this subject so exciting Thus papers run the gamut from sublogarithmic space to exponential time and from new combinatorial techniques to interactive proof systems **Report**

The Power of Interaction Carsten Lund, 1992 The Power of Interaction presents a new algebraic technique for constructing interactive proof systems and demonstrates the immense power of randomization and interaction in proving statements efficiently Lund shows that two provers can interact with a randomized verifier to provide proofs that are exponentially more efficient than traditional proofs and that one prover can interact with an efficient randomized verifier to prove statements that have no known efficient traditional proofs Carsten Lund is a Postdoctoral Fellow at AT T Bell Laboratories
