**Use the Key Concepts below to answer questions**

- When liquid water becomes warmer it can evaporate and become water vapor in the air. All air contains water.
- When an air parcel is warmer than the surrounding air it will rise and the water vapor in an air parcel cools, it can condense into liquid water which can form a cloud and fall as rain.
- As an air parcel rises, energy transfers from the warm air parcel to the cold surrounding air until their temperatures become equal.
- The more an air parcel loses energy and cools, the more rainfall can happen.
- The troposphere is warmest at the surface and coldest at its highest point.
- When an air parcel starts with a higher temperature, it will rise higher and lose more energy, causing more rainfall.
- Systems go through periods of stability and periods of change.
- Air moving from areas of high pressure to areas of low pressure is wind.
- Air parcels can be pushed up into the troposphere by wind (moving air).
- The warmer an air parcel is, the higher in the colder troposphere it will go, transferring energy to the cool surrounding air causing the water vapor to condense into more condensed liquid water causing more rain.
