II. POWER PLANT AND PROPELLER:

The Super Cub "90" is powered with a Continental C-90B engine or a C-90-12F if starter and generator (optional equipment) are installed. These engines are rated at 90 H. P. at 2475 R. P. M.

The Super Cub "150" is powered with a Lycoming O-320 engine, with a rated horsepower of 150 at 2500 R. P. M. The standard installation of this engine is also without electrical system, which is available optionally.

The steel tubular engine mount on the Super Cub models is mounted to the fuselage at the firewall on hinges, so that the rear of the engine can readily be made accessible for service. To hinge the motor mount, first remove the top, side and bottom engine cowl panels, which are quickly detachable by means of cowl fasteners. Next detach the rear end of the cowl support channels from their firewall brackets, extract the right hand hinge bolts, disconnect the tachometer shaft at the engine and swing the right side of the engine forward until the stop mechanism is extended.

The standard propeller on the Super Cub "90" is the Symmach wood propeller design 724GR-50. A Symmach metal propeller design 26-AN-242 is available as optional equipment. On the "150", the standard propeller is the Symmach metal design 7410M-50. In general, propeller designs selected for the Super Cub models emphasize take-off, climb and economical cruising performance rather than high speed cruising. If propellers with higher pitches are used, the cruising speed can be increased somewhat.

A stainless steel exhaust system is employed on the "150" to scavenge exhaust gases effectively. This permits the use of an efficient muffler without any loss in engine power output due to exhaust backpressure. The muffler is designed to provide sources of heat for the valves and carburetor heating systems.

III. FUSELAGE AND WINGS:

The fuselage frame of the Super Cub is constructed of steel tubes welded together to form a rigid structure. A number of highly-stressed members are of chromenickelchromium steel (1130). Other members are of 1025 steel.

Repairs to the fuselage can be made in the manner approved by the Civil Aeronautics Authority Manual No. 15, and repair facilities for this type of construction are available universally.

The fuselage is made corrosion resistant by the application of a coat of zinc chromate, followed by a weaker coat of nitrate dope. A third coat of dope proof lacquer is sprayed on the fuselage members whenever fabric comes in contact with the structure. If the airplane is to be used in salt water areas, the fuselage can be installed prior to applying the zinc chromate and dope; at the same time the interior of the tubing is coated with linseed oil to prevent internal corrosion.

The wing framework consists of riveted aluminum ribs mounted on extruded aluminum spars with tubular drag and compression struts and high strength stainless steel drag wires. Aluminum sheet is used to form the leading edge and the aileron fairing spar. An ash wing tip fairing provides a light tough member which can withstand considerable wing tip shock without failing.

The wings are attached to the fuselage at the wing hinge fittings on upper fuselage members, and by means of the lift struts which bolt to the lower fuselage members and to the wing spar fittings. The lift struts can be adjusted in length by turning in or out the locked fittings at the lower ends. This adjustment is used to set the rigging
