

Greenhouse Gases / The Greenhouse Effect

The greenhouse effect is the way in which heat is trapped close to Earth's surface by "greenhouse gases." These heat-trapping gases can be thought of as a blanket wrapped around Earth, keeping the planet toaster than it would be without them. Greenhouse gases include **carbon dioxide**, **methane**, **nitrous oxides**, and **water vapor**.

Like a greenhouse keeps plants warm so they can grow and flourish, greenhouse gases keep the Earth warm. However, too much greenhouse gases can cause climate change.

There are 5 types of gases that contribute to the greenhouse effect. But of these gases, carbon dioxide (CO_2) has the largest percentage at about 56% of all greenhouse gases.
