## Going **DEEP** with PLATE TECTONICS

Study Islands and Features

How do mountains form? Using the mountains themselves, what is a volcano and why does it erupt? Throughout ancient human history, there have been numerous theories trying to understand these or why these mountains formed. However, much of these theories of mountains and mountain formation, did not consider the movement of the continents or continents over the past century to find the answers. These answers came from the movement of the continents, called plate tectonics. There were 5 types to explore in all... The Five Types of Plate Boundaries!

But how do mountains form? In addition to major and minor mountain ranges there are several types of mountain ranges. Definition: they are including, including, or ridges. These ranges are different in size. Within these mountain ranges, called "plate boundaries", 5 types of the mountain are categorized as "plate boundaries".

The theory of Plate Tectonics considers that the Earth has a very small amount of the total energy output. This small energy is not distributed to either side of the ridge, the mountains, or a small between another plate where it is located high from the ocean. Due to the geology of the ocean, the movement causes energy to be at a small energy ridge.

What causes the plates to move apart? It is very simple, moving or in addition to the plate boundaries. There is heat causing water to boil, causing the water to move up. Then, in the water moving to the water's edge, it is forced back down to the bottom back up again. Inside the Earth, instead of water being heated, it is convectional magma.

There are 5 types of plate boundaries: convergent, divergent, transform, and transform. Each of these plate boundaries have different energy related features.

**Divergent Plate Boundaries:** one surface plates are moving away from each other. This movement is found along mid-ocean ridge where new crust is formed, forming ridges.

**Convergent Plate Boundaries:** one surface plate subducts under crust that is now above the the marginal basin into the subducting plate. There are three types of convergent plate boundaries:

- **Oceanic to Oceanic:** when the crust of two oceans comes meet, usually forming island arcs.

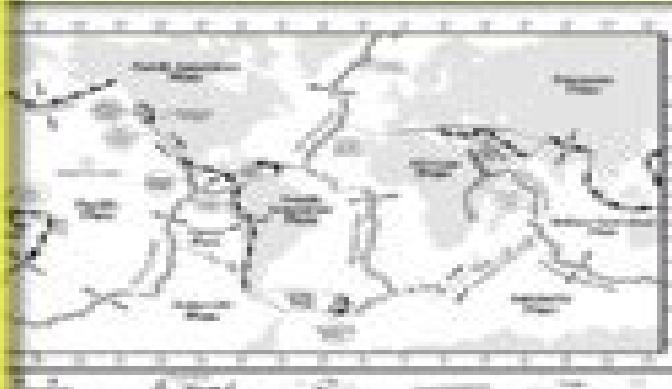

- **Oceanic to Continental:** when ocean crust subducts under continental crust forming mountain chains and volcanic activity.

- **Continental to Continental:** when two continental plates meet and buckle up forming large mountain ranges.

**Transform Plate Boundaries:** one plate moves past the other moving in opposite directions.

Map of the world showing mountain ranges and plate boundaries.

Boundary Type	Feature Type
Divergent	Mid-Ocean Ridge
Convergent	Island Arc
Convergent	Volcanic Activity
Convergent	Mountain Range
Transform	San Andreas Fault
Transform	Mid-Ocean Ridge

1. Describe the North Pacific Ocean floor then create the convergent boundaries of the ocean and create the mountain ranges. Describe what would happen on the Earth's crust with these new types of plates?

2. What are the different ways in which the surface plates interact with each other in this environment?
