

Interior of the Sun

The Sun

- The Sun is a sphere, composed almost entirely of the elements hydrogen and helium.
- The Sun is not solid, nor is it a typical gas.
 - It does not have a defined outer boundary.
 - It does have a definite internal structure with identifiable layers.
 - Most atoms in the Sun exist as **plasma**.
- Fourth state of matter made up of superheated gas with a positive electrical charge.

Study Tip

How would scientists use cameras to observe different layers of the Sun? Hint: Different temperatures are associated with different wavelengths on the electromagnetic spectrum!

Internal Structure

From inward to outward, the layers of the Sun are:

- **Central Core**
 - Plasma with a temperature is around 27 million °C.
 - At high temperatures hydrogen goes through **nuclear** fusion, which forms helium.
 - This energy moves outward, towards outer layers of the Sun.
- **Radiative Zone**
 - Temperature of about 7 million °C.
 - Energy from core travels extremely slowly through here.
 - **Photons** (particles of light) travel only a little before they hit another particle.
 - The photon is absorbed and then released again.
- **Convection Zone**
 - Hot material from near the radiative zone rises, cools at the Sun's surface, and plunges back downward to the radiative zone.
 - Convective movement helps to create solar flares and sunspots.

The Outer Layers

There are no solid layers to any part of the Sun's atmosphere; these boundaries are fuzzy and indistinct.
