WHAT YOU SHOULD KNOW ABOUT YOUR IRON STUDIES

Iron Studies are a group of tests performed on the same blood sample. Together, they measure the amount of iron in your body.

Often Iron Studies are ordered along with other tests such as the Full Blood Count and Liver Function Tests. Iron is vital to health. Iron is used in many body processes. Its main job is to form part of haemoglobin, a substance in red blood cells that takes up oxygen from the lungs and releases it as the blood travels around the body.

Iron deficiency anaemia

If you don't have enough iron, you can't produce the haemoglobin needed to take oxygen around your body. This is called iron deficiency anaemia, and it may leave you tired and short of breath. Low iron levels can be caused by many things, including monthly periods, pregnancy, and bleeding in the stomach and intestines, such as in inflammatory bowel disease and bowel cancer.

Iron overload and haemochromatosis

Having too much iron in your body can cause damage to your heart, liver and pancreas as well as your joints. The most common reason for iron overload is the inherited disorder, haemochromatosis.

We take in iron from the food we eat. It is absorbed through our small intestines. We don't have a mechanism for removing iron from the body so it's important that it takes in just what it needs and no more. There is a finely tuned regulatory system for making sure it does that. In hereditary haemochromatosis there is a breakdown in the process that controls iron absorption. The body acts as if there is an iron shortage and responds by absorbing more from food. This means there is more iron being taken in but no mechanism to get rid of it.
