Earth's Interior Layers

To review:

- The Earth is not entirely the same all the way throughout the inside of the planet. Instead, Earth is made up of distinct layers that have their own characteristics and composition. This means they are made of different materials and behave differently from one another.
- We can use seismic waves (shakes caused by an earthquake or Earthquake) to figure out layers, since as waves travel through different materials, they travel through the different layers to differ what the inside of the Earth is like.
- There are three different types of crust – comparing what constitutes:
 - Continental crust is the thinnest. It is thicker and more dense than continental crust. This means that it is broken into continents with a continental plate, it will sink. It is process called subduction.
 - Continental crust is the thinnest and less dense than oceanic crust. This means that it is broken into continents with an oceanic plate, it will "override" the plate and go on top of it.
- Interestingly the crust is the thinnest layer of the Earth's interior, the mantle. This area is solid but behaves like a liquid due to being too hot, not under pressure. There are two distinct parts of the mantle:
 - The upper mantle (asthenosphere) and the lower mantle.
- The asthenosphere and crust stick together – this is called the lithosphere. When we refer to tectonic plates, we are referring to the lithosphere.
- Plate movement is caused by convection currents in the lower mantle.

• The lower mantle, rock moves up and down. When it moves up, it will cool and
