## **Weld Design Guide:**

**Handbook of Plastics Joining** PDL Staff, 2008-10-23 A hands on guide to choosing and using old and new technologies for joining plastics and elastomers. Includes detailed discussions of over 25 techniques used to join plastics to themselves and to other materials. Advantages and disadvantages of each technique along with detailed discussions of applications are presented. A second section is organized by material and provides details of using different processes with over 50 generic families of plastics and how different techniques and operating parameters affect weld strength and other criteria. This book is an excellent reference and an invaluable resource for novice and expert alike in determining the best joining technique for their application and providing guidance in how to design and prepare for production

### **Handbook of Plastics Joining**

Michael J. Troughton, 2008-10-17 The new edition of this bestselling reference provides fully updated and detailed descriptions of plastics joining processes plus an extensive compilation of data on joining specific materials. The volume is divided into two main parts processes and materials. The processing section has 18 chapters each explaining a different joining technique. The materials section has joining information for 25 generic polymer families. Both sections contain data organized according to the joining methods used for that material. A significant and extensive update from experts at The Welding Institute. A systematic approach to discussing each joining method including process advantages and disadvantages, applications, materials, equipment, joint design and welding parameters. Includes international suppliers directory and glossary of key joining terms. Includes new techniques such as flash free welding and friction stir welding. Covers thermoplastics, thermosets, elastomers and rubbers

### **Contribution on the behavior of welded joints to metallic structural elements with tubular section**

Dr.-Ing. Patrick Heinemann, 2023-02-22  
Doctoral Thesis Dissertation from the year 2022 in the subject Engineering Civil Engineering grade Summa cum laude  
language English abstract Steel structures which are made of hollow section profiles are mainly used for construction structures. There are many fields of applications for structures made of hollow section profiles. Hollow section profiles are lightweight and have got a high resistance to compression which is an advantage for column structures. The most common profile types have squared or circular hollow cross sections. Connecting two or more pipes by welding the joints have got different shapes. These joints are part of trusses or columns with a tree shaped optic. The standards have got restrictions regarding the geometry, material or load cases. By choosing a node which is excluded in the standards, designing engineers have to create their own models. This thesis is about the designing of a Y shaped steel joint full overlapped on top connection which is not defined in current standards up to the time the thesis is created. In this thesis only uniplanar joints are investigated. A special focus is on the welding line which has got a three dimensional shape. The aim is to figure out the influence on the inclination angle between the two members on the resistance of the joint. Beside this the profile shape and profile thickness vary to see the differences in their resistance. Square and circular hollow section profiles are in focus. To

analyse the behaviour of the different steel joints a numerical and experimental investigation is executed Design charts are created as a medium for designing engineers to calculate the ultimate resistance in the elastic and plastic state depending on the steel profile thickness and inclination angle The structure of the thesis is split into four main parts Firstly there is an explanation of the general topic with its difficultness Secondly there is the state of the art presentation of literature and standards in this range Thirdly there is a numerical analysis of the joints The basement of the numerical studies is detailed in pre studies which explain and compare different mesh types or geometrical variations Fourthly there is an experimental verification of the numerical tests It is figured out if the inclination angle increase the resistance of the steel joint will decrease significantly This effect is non linear Beside this it is found that the full overlapped joint with the squared profile has got a higher resistance than a comparable joint with a similar circular hollow section **Design Guide 2** T.
