Weighted Network Analysis Steve Horvath,2011-04-30 High throughput measurements of gene expression and genetic marker data facilitate systems biologic and systems genetic data analysis strategies Gene co expression networks have been used to study a variety of biological systems bridging the gap from individual genes to biologically or clinically important emergent phenotypes Novel Methods and Applications of Weighted Gene Coexpression Network Analysis Tova Frani Fuller,2010 WGCNA: an R Package for Weighted Correlation Network Analysis Applied Research Applied Research Press,2015-09-16 Correlation networks are increasingly being used in bioinformatics applications For example weighted gene co expression network analysis is a systems biology method for describing the correlation patterns among genes across microarray samples Weighted correlation network analysis WGCNA can be used for finding clusters modules of highly correlated genes for summarizing such clusters using the module eigengene or an intramodular hub gene for relating modules to one another and to external sample traits using eigengene network methodology and for calculating module membership measures Correlation networks facilitate network based gene screening methods that can be used to identify candidate biomarkers or therapeutic targets These methods have been successfully applied in various biological contexts e g cancer mouse genetics yeast genetics and analysis of brain imaging data While parts of the correlation network methodology have been described in separate publications there is a need to provide a user friendly comprehensive and consistent software implementation and an accompanying tutorial The WGCNA package provides R functions for weighted correlation network analysis e g co expression network analysis of gene expression data The R package along with its source code and additional material are freely available at <http://www.genetics.ucla.edu/labs/horvath/CoexpressionNetwork/Rpackages/WGCNA>

J. Veelenturf,1995 This volume is an analysis of the behaviour of the three types of neural networks the binary perceptron the continuous perceptron and the self organizing neural network Analysis is largely mathematical but concepts are also explained through practical examples Symbolic Network Analysis Pen-Min Lin,1991 The value of symbolic network analysis is now well recognized In industry it has been used as an aid in the design of small linear networks In academic institutions it has been found useful as an instructional aid The purpose of this book is to present in a single volume a unified treatment of all symbolic analysis methods using a consistent set of notation and based on the same theoretical background network topology combinatorial analysis and numerical analysis The emphasis is on those methods which have been implemented and for which there are source codes available The work will be of interest to all those who have the usual college level training in circuit theory **On the Topological Properties of the World Trade Web** Giorgio

Fagiolo,2014 This paper studies the topological properties of the World Trade Web WTW and its evolution over time by employing a weighted network analysis We show that the WTW viewed as a weighted network displays statistical features that are very different from those obtained by using a traditional binary network approach In particular we find that i the majority of existing links are associated to weak trade relationships ii the weighted WTW is only weakly disassortative iii countries holding more intense trade relationships are more clustered Proceedings of the National Academy of Sciences of the United States of America National Academy of Sciences (U.S.),2006 Graph Theory Wataru Maeda,1972

networks which describe a wide range of real world systems in nature and society Identification of the central elements in such networks is one of the key research areas Solutions to this problem are important for making strategic decisions and studying the behavior of dynamic processes e g epidemic spread The importance of nodes has been studied using various centrality measures Generally it should be considered that most real systems are not homogeneous nodes may have individual attributes and influence each other in groups while connections between nodes may describe different types of relations Thus critical nodes detection is not a straightforward process New Centrality Measures in Networks presents a class of new centrality measures which take into account individual attributes of nodes the possibility of group influence and long range interactions and discusses all their new features The book provides a wide range of applications of network analysis in several fields financial networks international migration global trade global food network arms transfers networks of terrorist groups and networks of international journals in economics Real world studies of networks indicate that the proposed centrality measures can identify important nodes in different applications Starting from the basic ideas the development of the indices and their advantages compared to existing centrality measures are presented Features Built around real world case studies in a variety of different areas finance migration trade etc Suitable for students and professional researchers with an interest in complex network analysis Paired with a software package for readers who wish to apply the proposed models of centrality in Python available at <https://github.com/SergSHV/slric>
