effect Computer simulation of dynamic systems is a topic which is growing steadily in importance and cheaply than by
experimentation and testing of the real system System perform in the physical sciences engineering biology and medicine The
reasons for this trend can also be investigated using simulation relate not only to the steadily increasing demand for a much
wider range of conditions than can be contemplated for the real system power of computers and the rapidly falling costs of
hardware but also to the availability because of operating constraints or safety of appropriate software tools in the form of
requirements Similar factors can apply in simulation languages Problem oriented languages in other fields such as biomedical systems
languages of this kind assist those who are not engineering specialists in computational methods to transform System simulation
using digital computers can relate either to models based on continuous mathematical description into a simulation
program in a simple and straightforward manner using continuous variables or to discrete event descriptions in discrete fashion They can also provide useful
diagnostics Continuous system simulation techniques are applied to systems described by sets of differential equations when
difficulties are encountered Therefore a simulation language can handle differential equations and algebraic equations **Subject Guide to**
