Describe the blood flow through the heart, including the chambers, pulmonary circulation, and valves. - Answers -First, the deoxygenated blood enters the heart through the superior and inferior vena cava. The deoxygenated blood then fills up in the right atrium. The tricuspid valve opens allowing the blood to fill up the right ventricle. When the right ventricle contracts, the pulmonary valve opens and the deoxygenated blood travels through the pulmonary artery and goes to the lungs. In the lungs, the CO<sub>2</sub> in the blood exchanges with the O<sub>2</sub> in the alveoli and the blood becomes oxygenated. The blood then returns to the heart through the pulmonary veins into the left atrium. The mitral valve opens and the left ventricle is filled with oxygenated blood. When the ventricle contracts, the blood goes through the aortic valve and into the aorta as it supplies oxygenated blood to the rest of the body.

Explain the steps of operating an Automated External Defibrillator (AED). - Answers -If a bystander CPR is in progress, assess the effectiveness of their chest compressions by feeling for the carotid or femoral pulse. If they are effective, you should be able to feel a pulse. Then, you should leave your fingers in that position and stop compressions to see if the patient has a pulse. If no pulse, resume compressions. It is important to reduce interruptions to compressions. Then, go get an AED. If the patient is responsive, and AED is not needed. If the patient is unresponsive and CPR has not been started, begin chest compressions right away with a ratio of 30 compressions and 2 breaths with compressions being a rate of 100 to 120 per minute. Continue CPR until the AED arrives and is ready for use. It is important to start compressions and use the AED as soon as possible. Turn on the AED. Remove clothing in the chest area. Dry any wet spots. Shave if there is an excessive amount of hair. Apply the pads to the chest (one to the right of the sternum, right below the clavicle, and the other on the left lower area, 2-3 inches below the armpit. Plug in the pads connector to the AED. Stop CPR when the AED instructs so and state aloud, "clear the patient," and ensure that no one is touching the patient. Let the AED analyze and determine whether the rhythm is shockable. If a shock is advised, perform chest compressions as the AED charges. If not, continue to perform 5 cycles of CPR (about 2 minutes) before reanalyzing the rhythm with the AED. If a shock is advised, reconfirm that no one is touching the patient and push the shock button. If the AED advises you check the patient, quickly assess for a carotid or femoral pulse and look for any breathing. This should not take longer than 5 to 10 seconds. If there is return of spontaneous circulation (ROSC), continue to monitor the patient. If there isn't ROSC, immed
