Application Support for Mobile Computing Steven Leslie Pope,1997 Abstract In recent years small completely portable computers have become available on the marketplace There is demand for such computers termed walkstations to access network services while retaining their mobility and to operate effectively in a wide range of conditions Future office environments are expected to support wireless networks with bandwidths which are several orders of magnitude greater than are available outdoors In such environments there will be powerful compute servers available for a walkstation s use This dissertation describes a novel architecture called Notus and its support for applications operating in a mobile environment The concept of the traded handoff is introduced where applications are able to participate in the handoff process rebuilding connections to the most appropriate service This is expected to benefit walkstations which roam over large distances where connections to servers would otherwise be strained and also between heterogeneous networks where cooperation between the networks in performing a handoff might be problematic It is also proposed in this dissertation that applications could benefit from the ability to migrate onto compute servers as a walkstation moves into the office environment This enables both the walkstation to conserve its own resources and applications to improve the service provided to the end user Finally by interleaving a traded handoff with the migration process it is possible for a migrating application to easily rebuild its connections as it moves to a new host The Notus architecture has been implemented including a traded handoff service and a new application

migration service The new application migration service was designed since existing application migration services are unsuited to mobile environments and it enables applications to migrate between heterogeneous hosts with little disruption Applications which use the service are written in a standard compiled language and normal running applications suffer little overhead A number of existing applications which are representative of a workstation's interactive desk top environment have been adapted to use the Notus architecture and are evaluated In summary this work describes how mobility awareness and the support from appropriate tools can enable workstation applications to better adapt to a changing mobile environment particularly when the workstation is carried between different network types or over great distances
