

Lesson Outline**LESSON 2****Understanding Inheritance****A. What controls traits?**

1. Inside each cell is a nucleus that contains threadlike structures called **chromosomes**.
2. Mendel's factors are parts of chromosomes, and each cell in the offspring contains chromosomes from both parents.
3. A **gene** is a section on a chromosome that has genetic information for one trait.
4. The different forms of a gene are called **alleles**.
5. Geneticians refer to how a trait appears, or is expressed, as the trait's **phenotype**.
6. The two alleles that control the phenotype of a trait are called the trait's **genotype**.
 - a. In genetics, uppercase letters represent dominant alleles, and lowercase letters represent recessive alleles.
 - b. When two alleles of a gene are the same, its genotype is **homozygous**.
 - c. If two alleles of a gene are different, its genotype is **heterozygous**.

B. Modeling Inheritance

1. In a situation based on chance, such as flipping a coin, the chance of getting a certain outcome can be represented by a(n) **ratio**, such as 20:40, or 1:2.
2. A **Punnett square** is a model that is used to predict possible genotypes and phenotypes of offspring.
 - a. To create a Punnett square, you need to know the genotype of both parents.
 - b. If you count large numbers of offspring from a particular cross, the overall ratio will be close to the ratio predicted by a Punnett square.
3. A **pedigree** is a diagram that shows phenotypes of genetically related family members. It also gives clues about their genotypes.
