Computational and Experimental Protein Variant Interpretation in the Era of Precision Medicine Daniele Dell'Orco,Valerio Consalvi,Silvia Morante,Paola Turina,Tiziana Sanavia,Arthur M. Lesk,Constantina Bakolitsa,2024-01-26 One of the key goals in the postgenomic era is the elucidation of the mechanisms underlying the relationship between genotype and phenotype In particular understanding how human genetic and somatic variations are associated with diseases is still an open problem and its solution is a crucial issue for exploiting the possibilities offered by the modern sequencing techniques in the framework of precision and personalized medicine The increasing amount of data generated by the sequencing initiatives calls for accurate and reliable computational approaches

to predict the impact of mutations on the phenotype and possibly for methods to correlate them with diseases From the experimental point of view disease causing variants are supposed to directly affect protein function protein stability as well as the kinetics and thermodynamics of protein protein recognition and robust validation at the molecular scale is necessary This approach can be of invaluable help in facing new challenges such as the fast development of effective vaccines
