SUMMARY

The CD44v6 epitope has been widely reported to be expressed in human mammary carcinomas, yet its prognostic significance is controversial and its function in mammary tumors and mammary glands is unknown. To begin to resolve these issues, we analysed in detail the normal postnatal expression patterns and regulation of the CD44v6 epitope in murine mammary glands. We demonstrate that significant CD44v6 epitope expression is first seen during puberty, and that after puberty CD44v6 epitope expression follows the estrous cycle. CD44v6 epitope expression is observed in the myoepithelium and also less widely in luminal epithelial cells. During lactation, CD44v6 epitope expression is turned off and reappears during involution. The CD44 variant isoform bearing the v6 epitope is CD44v1-v10. Using HC11, a mammary epithelial cell line with stem cell characteristics, and facilitated by the cloning of the murine CD44 promoter, we show that growth factors and hormones which regulate ductal growth and differentiation modulate CD44

transcription. Together our data suggest that the CD44v6 epitope is expressed in mammary epithelial stem cells and in lineages derived from these cells, and that CD44v6 expression is regulated in part by hormones and growth factors such as PDGF-1 and EGF which regulate the growth and differentiation of the mammary epithelium. The function of these same growth factors and hormones is often perturbed in mammary carcinomas, and we suggest that CD44v6 expression in tumors reflects this perturbation. We conclude that the expression of the CD44v6 epitope observed in some mammary tumors reflects the stem cell origin of breast tumors, and that whether or not the CD44v6 epitope is expressed in a mammary tumor is determined by the differentiation status of the tumor cells.

INTRODUCTION

Modulation of the expression of the family of cell surface proteins called CD44 has been implicated in the tumor progression and metastasis of a variety of human carcinomas (reviewed by Naor et al., 1997). Most of the diversity in the CD44 family is produced by the incorporation of amino acid stretches encoded by ten alternatively spliced exons into one particular part of the extracellular portion of the CD44 proteins, close to the transmembrane domain. The most common and widely expressed 85 kDa isoform does not include any of these variant exons (CD44s). Expression of variant isoforms of CD44 containing sequences encoded by multifarious combinations of variant exons (CD44v) is restricted mainly to a limited selection of epithelia in normal somatic tissue (Naor et al., 1997). Numerous studies have reported that expression of epitopes encoded by these variant exons correlates with

tumor progression (Naor et al., 1997). The finding in animal models that anti-CD44v6 antibodies can block tumor growth and metastasis (Reber et al., 1990; Seiter et al., 1993; Sleeman et al., 1996) and that ectopic expression of CD44 proteins containing the exon v6-encoded sequence can promote metastasis (Günthert et al., 1991; Rudy et al., 1993) has especially prompted much research into whether CD44v6 epitope expression in human cancers has a functional role.

In human mammary carcinomas, a significant number of primary tumors stain positively for the CD44v6 epitope, ranging from 24%-85% depending on the antibody used (Kaufmann et al., 1995; Sinn et al., 1995; Freidenrich et al., 1995; Tempfer et al., 1996; Jansen et al., 1998; Toluse et al., 1998; Fockens et al., 1999). Where investigated, 92% (Tempfer et al., 1996) - 100% (Kaufmann et al., 1995; Sinn et al., 1995) of metastatic deposits were CD44v6 epitope-positive. The prognostic significance of CD44v6 epitope expression is

Suzanne Klimberg, 2009-09-09 *The Breast Comprehensive Management of Benign and Malignant Diseases* 4th Edition by Kirby I Bland MD and Edward M Copeland III MD is a surgical reference that offers the most comprehensive up to date resource on the diagnosis and management of and rehabilitation following surgery for benign and malignant diseases of the breast. With its multidisciplinary approach sweeping updates new contributors and authoritative guidance you'll have exactly what you need to inspire patient confidence and provide the best possible outcomes. Features multidisciplinary advice from experts in surgery, radiation and medical oncology, pathology, molecular biology, pharmacokinetics and genetics for a well rounded perspective to enhance patient outcomes. Includes more than 1 500 figures and tables that offer high quality depictions of surgery and treatment procedures. Offers step by step guidance through both text and clinical boxes that makes the material relevant to everyday practice. Provides cross referencing between chapters as well as references to carefully selected journal articles that makes further research easier. Uses a new full color design to highlight key areas of the text and help you focus on important concepts. Presents updated coverage including an expanded section on pathology and new chapters on granular cell tumors, targeted therapies, integration of radiotherapy and chemotherapy to keep you current. Includes revised chapters on the psychosocial consequences of breast cancer, lifestyle interventions for breast cancer patients and patient and family resources that equip you to offer complete and compassionate care. Provides additional information on genetics to keep you up to date with the latest genetic discoveries linked to breast cancer and breast diseases. Features the work of many new contributors who provide the latest and freshest perspectives. Immunology and Biology National Cancer Institute NIH The study of hormones is critical to our understanding of developmental aberrations leading to cancer and the discovery of polypeptide growth factors has led to profound insights into the duality of control of development and cancer by hormones at the tissue and cellular levels In this book leading researchers in the field present a cohesive overview of several important growth factor systems and how they interact with endocrine hormones in the context of tissue tissue interactions control of cellular growth differentiation and death and reciprocal control of receptors and ligands at the molecular level In its first two sections Hormones and Growth Factors in

Development and Neoplasia introduces important growth factors and hormonal systems in invertebrate and amphibian model systems highlights early evolutionary and developmental functions for the classes of molecules later shown to be important in human cancer establishes the roles of growth factors and hormones in mammalian development and focuses on early

embryonic events and later events leading to sexual dimorphism The book s third section discusses in detail the control of postnatal developmental processes in male and female reproductive tracts focusing on the prostate and mammary glands as well as the female reproductive tract all of which are of special importance in hormonally driven cancers Finally the book

takes a direct look at cancers and the molecular mechanisms of hormone growth factor interactions Among the many topics covered in this timely volume are Ecdysone in development of Drosophila The progesterone receptor in mammalian
