<b>Electrical Conductors and Insulators</b>	
<b>What is Electrical Resistance?</b> Resistance is the ability that materials have to resist the flow of electric current. The higher the resistance, the more difficult it is for current to flow through the material. Materials with a high resistance are considered to be poor conductors of electricity. The best conductors of electricity are materials with a low resistance. They are called good conductors of electricity. They include metals such as copper, aluminum, and silver.	
<b>Conductors</b> Conductors are materials that allow electric current to pass through them easily. They include metals such as copper, aluminum, and silver.	
<b>Insulators</b> Insulators are materials that do not allow electric current to pass through them easily. They include rubber, plastic, wood, and glass.	
<b>Superconductors</b> Superconductors are materials that have zero resistance to electric current. They are used in magnetic resonance imaging (MRI) machines and in some types of power transmission lines.	
<b>Electrical resistors</b> Resistors are components that are used to control the amount of current that flows through a circuit. They are made of materials with a high resistance, such as carbon or metal oxide.	
<b>Electrical insulators</b> Insulators are components that are used to prevent electric current from flowing through a circuit. They are made of materials with a high resistance, such as ceramic or glass.
