Supercritical Fluid Cleaning Fundamentals Technology And Applications:

Supercritical Fluid Cleaning Samuel P. Sawan, 1998-12-31 Although supercritical fluid SCF technology is now widely used in extraction and purification processes in the petrochemical food and pharmaceuticals industries this book is the first to address the new application of cleaning The objective is to provide a roadmap for readers who want to know whether SCF technology can meet their own processing and cleaning needs It is particularly helpful to those striving to balance the requirements for a clean product and a clean environment The interdisciplinary subject matter will appeal to scientists and engineers in all specialties ranging from materials and polymer sciences to chemistry and physics It is also useful to those developing new processes for other applications and references given at the end of each chapter provide links to the wider body of SCF literature The book is organized with topics progressing from the fundamental nature of the supercritical state through process conditions and materials interactions to economic considerations Practical examples are included to show how the technology has been successfully applied The first four chapters consider principles governing SCF processing detailing issues such as solubility design for cleanability and the dynamics of particle removal The next three chapters discuss surfactants and microemulsions SCF interaction with polymers and the use of supercritical carbon dioxide CO₂ as a cleaning solvent The closing chapters focus on more practical considerations such as scaleup equipment costs and financial analysis

Physico-chemical Aspects of Textile Coloration Stephen M. Burkinshaw, 2016-02-08 The production of textile materials comprises a very large and complex global industry that utilises a diverse range of fibre types and creates a variety of textile products. As the great majority of such products are coloured predominantly using aqueous dyeing processes, the coloration of textiles is a large scale global business in which complex procedures are used to apply different types of dye to the various types of textile material. The development of such dyeing processes is the result of substantial research activity undertaken over many decades into the physico-chemical aspects of dye adsorption and the establishment of dyeing theory which seeks to describe the mechanism by which dyes interact with textile fibres. *Physico Chemical Aspects of Textile Coloration* provides a comprehensive treatment of the physical chemistry involved in the dyeing of the major types of natural, man-made and synthetic fibres with the principal types of dye. The book covers fundamental aspects of the physical and chemical structure of both fibres and dyes together with the structure and properties of water in relation to dyeing. Dyeing as an area of study as well as the terminology employed in dyeing technology and science, contemporary views of intermolecular forces and the nature of the interactions that can occur between dyes and fibres at a molecular level, fundamental principles involved in dyeing theory as represented by the thermodynamics and kinetics of dye sorption, detailed accounts of the mechanism of dyeing that applies to cotton and other cellulosic fibres, polyester, polyamide, wool, polyacrylonitrile and silk fibres, non-aqueous dyeing as represented by the use of air, organic solvents and supercritical CO₂ fluid as alternatives to water as application medium. The up-to-date text is supported by a large number of tables, figures and illustrations as well as footnotes and widespread use of references to published work. The book is essential reading for students, teachers, researchers and professionals involved in textile coloration **Particles on Surfaces Five and Six** Kashmiri Lal Mittal, 1999-09 This volume documents the Proceedings of the 5th and 6th Symposia on Particles on Surfaces: Detection, Adhesion and Removal held under the aegis of the Fine Particle Society in Chicago May 6-9 1996 and Dallas April 1-3 1998 respectively. The technical programs clearly reflected an interest and need to ameliorate the existing methods and to devise new and more efficient

ways to detect analyze and characterize particles on surfaces The removal of particles from a host of surfaces was especially highlighted the need to remove smaller and smaller particles was particularly underscored All manuscripts included in this volume were properly peer reviewed and all were revised before inclusion in this volume Thus this book is not a mere collection of unreviewed papers but represents information that has passed peer scrutiny Furthermore the authors of the 5th Symposium were asked to update the information So the information presented in this book should be as fresh and up to date as possible This volume is divided into two parts Part 1 General Papers and Part 2 Particle Adhesion and Removal The topics covered include high sensitivity rapid detection of particles detection of particles using evanescent wave scattering particles on the backside of wafers particle shedding from fluid handling components dynamics of particle adhesion particle dispersion aggregation precision cleaning and particle removal by surfactants supercritical fluids hydrodynamic forces high speed droplet impinging megasonic CO₂ blasting CO₂ snow argon aerosol lasers microcluster beams brush and chemical mechanical methods This volume offers bountiful information and represent a current commentary on the R D activity taking place in the area of particles on surfaces particularly particle removal from a variety of surfaces **JJAP**, 2009
