NVIDIA's breakthrough CUDA software platform that power can be put to work in virtually any type of software development that requires exceptionally high performance from finance to physics. Now for the first time two of NVIDIA's senior CUDA developers thoroughly introduce the platform and show developers exactly how to make the most of it. CUDA C by Example is the first book on CUDA development for professional programmers and the only book created with NVIDIA's direct involvement. Concise and practical, it focuses on presenting proven techniques and concrete example code for building high performance parallelized CUDA programs with C. Programmers familiar with C will need no other skills or experience to get started making high performance programming more accessible than it's ever been before.

Cuda for Newbies Dylan Skinner, 2016-11-26. CUDA is a parallel computing platform and application programming interface (API) model created by Nvidia. It allows software developers and software engineers to use a CUDA-enabled graphics processing unit (GPU) for general purpose processing, an approach termed GPGPU (General Purpose computing on Graphics Processing Units). The CUDA platform is a software layer that gives direct access to the GPU's virtual instruction set and parallel computational elements for the execution of compute kernels. The CUDA platform is designed to work with programming languages such as C, C++, and Fortran. This accessibility makes it easier for specialists in parallel programming to use GPU resources in contrast to prior APIs like Direct3D and OpenGL, which required advanced skills in graphics programming. Also, CUDA supports programming frameworks such as OpenACC and OpenCL. When it was first introduced by Nvidia, the name CUDA was an acronym for Compute Unified Device Architecture, but Nvidia subsequently dropped the use of the acronym. This updated and expanded second edition of the book provides a user-friendly introduction to the subject. Taking a clear structural framework, it guides the reader through the subject's core elements. A flowing writing style combines with the use of illustrations and diagrams throughout the text to ensure the reader understands even the most complex of concepts. This succinct and enlightening overview is a required reading for all those interested in the subject. We hope you find this book useful in shaping your future career.

*Multi-GPU Graph Processing* Yuechao Pan, 2019

While modern GPU graph analytics libraries provide usable programming models and good single node performance the memory size and the computation power of a single GPU is still too limited for analyzing large graphs Scaling graph analytics is challenging however because of the characteristics of graph applications irregular computation their low computation to communication ratios and limited communication bandwidth on multi GPU platforms Addressing these challenges while still maintaining programmability is yet another difficulty In this work I target the scalability of graph analytics to multiple GPUs I begin by targeting multiple GPUs within a single node Compared to GPU clusters single node multi GPU platforms are easier to manage and program but can still act as good development environments for multi GPU graph processing My work targets several aspects of multi GPU graph analytics the inputs that graph application programmers provide to the multi GPU framework how the graph should be distributed across GPUs the interaction between local computation and remote communication what and when to communicate how to combine received and local data and when the application should stop I answer these questions by extending the Gunrock graph analytics framework for a single GPU to multiple GPUs showing that most graph applications scale well in my system I also show that direction optimizing breadth first search DOBFS is the most difficult scaling challenge because of its extremely low compute to communication ratio To address the DOBFS scaling challenge I demonstrate a DOBFS implementation with efficient graph representation local computation and remote communication based on the idea of separating high and low degree vertices I particularly target communication costs using global reduction with bit masks on high degree vertices and point to point communication to low degree vertices This greatly reduces overall communication cost and results in good DOBFS scaling with log scale graphs on more than a hundred GPUs in the Sierra early access system the testing bed for the Sierra Supercomputer Next I revisit the design choices I made for the single node multi GPU framework in view of recent hardware and software developments such as better peer GPU access and unified virtual memory I analyze 9 newly developed complex graph applications for the DARPA HIVE program implemented in the Gunrock framework and show a wide range of potential scalabilities More importantly the questions of when and how to do communication are more diverse than those in the single node framework With this analysis I conclude that future multi GPU frameworks whether single or multiple node need to be more flexible instead of only communicating at iteration boundaries they should support a more flexible general communication model I also propose other research directions for future heterogeneous graph processing including asynchronous computation and communication specialized graph representation and heterogeneous processing
