*Use the words in the box to fill in the blanks.*

aluminum	amethyst	crystal	demand
expense	gems	ores	polished
profit	rare	supply	
traces	useful	value	

Stones called **gems** are highly prized minerals because they are

Beautiful and often **rare**. Many gemstones have a

**crystal** structure that allows them to be cut and

**polished** to the high quality needed for jewelry. The difference between a

gemstone and the common form of the same mineral is sometimes slight. The purple stone,

**amethyst**, for example, is quartz with just **traces** \_\_\_\_\_

of iron in its structure.

Some minerals contain a **useful** substances that can be mined at

a **profit**. Such minerals are called **ores** \_\_\_\_\_.

Bauxite is this kind of mineral because **aluminum** can be taken from it and

made into useful products. In most cases, waste rock or material must be removed before a mineral

can be used. If the **expense** of mining gets higher than the

**value** of the material, the mineral is no longer considered to be an ore.

The value of the material can also change if the **supply** or the

**demand** increases or decreases.
