**Running Buildings on Natural Energy** Sue Roaf, Fergus Nicol, 2018-12-07 New thinking is essential if we are to design and occupy buildings that can keep us safe with unpredictable economies, climates, energy systems and resource challenges. For too long designers have relied on mechanical solutions for heating, cooling and ventilating buildings. The 21st century dream has to be of a better architecture that enables buildings to be run for as much of a day or year as possible on local, clean, reliable, affordable natural energy. Examples are included from different climates where the fundamental building design is right: its orientation, opening sizes, mass and its natural ventilation systems and pathways. Many modern buildings are poorly designed for climate as manifested by growing incidences of overheating experienced indoors explored here. The inability of many rating systems to record and improve the climatic design of buildings raises questions about how they deal with issues of basic building performance. This book points the way towards how we can understand such problems and move forward from over-mechanised poorly designed buildings to a new generation of adaptable buildings designed and refurbished to run largely on natural energy and capable of evolving over time to keep their occupants safe and comfortable even in a warming world. The chapters were originally published in *Architectural Science Review* *Natural Disasters and Risk Management in Canada*. Nirupama Agrawal, 2018-03-27 These chapters provide valuable and comprehensive information on a variety of hazards including both scientific and social aspects of disasters. The work introduces the concept of large, medium and small scale hazards and includes many useful case studies as well as working examples of theoretical concepts. As readers will acknowledge today the distinction between natural and technological hazards is becoming blurred and a new concept of NATECH hazards is evolving. For permanent hazards such as tides, wind, waves, coastal erosion and climate change routine predictions are made whereas for evanescent hazards including droughts, sea level rise and coastal subsidence monitoring of various parameters is the norm. Only for episodic hazards for example hurricanes, winter storms, tsunamis and river floods early warning systems are used with varying degrees of success. The book explores how for certain episodic hazards like tornadoes, landslides, forest fires, snow avalanches and volcanic eruptions the early warning systems are still in various stages of development. Readers will gain knowledge of theoretical and practical concepts of risk evaluation which assist in better understanding of disaster dynamics and readers will become better equipped in quantification of disaster risk and vulnerability. The author explains how risk reduction initiatives taking into account stakeholders' participation and perception can provide a roadmap to building resilient communities and cities. This book will be useful not only to practitioners of disaster management but also to research scholars and graduate students. It is highly readable and will appeal more broadly too to all those who are interested in the very latest thinking on and expert analysis of hazards and disasters.
