\_\_\_\_\_ is a mixture of weathered rock & organic matter that usually covers \_\_\_\_\_ (solid rock that underlies all soil). Both chemical & mechanical processes are involved in the development of soils.

- 1) \_\_\_\_\_ weathering turns hard minerals into soft ones
- 2) \_\_\_\_\_ weathering breaks solid rock into smaller pieces
- 3) \_\_\_\_\_ add organic materials in the form of waste products & dead organisms
- 4) The decay of \_\_\_\_\_ produces acids which accelerate chemical weathering
- 5) \_\_\_\_\_, such as earthworms, insects, & rodents, help circulate air and water through the soil & mix mineral & organic remains

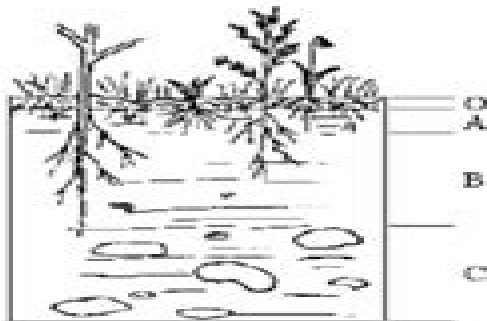

The material from which soil forms is called its \_\_\_\_\_. Soil that has weathered directly from the bedrock beneath it and therefore matches its parent material is called \_\_\_\_\_.

Soil that does not match the bedrock it is over is called \_\_\_\_\_. It did not weather from the bedrock beneath it but was brought there by agents of erosion such as winds, rivers, or glaciers.

A cross section of soil exposed by digging is called the \_\_\_\_\_. The weathering of soil produces layers known as **soil horizons**. The topsoil or \_\_\_\_\_ is usually rich in dark-colored organic remains called \_\_\_\_\_ (**labeled O horizon below**). The subsoil or \_\_\_\_\_ contains minerals that have been transported deeper by groundwater. Most of the clay in soil has also been washed down to this layer. The partially weathered bedrock or \_\_\_\_\_ is composed of broken up bedrock on top of the solid bedrock (parent material).

\_\_\_\_\_ is the removal of topsoil by the action of running water or wind. It takes between 100 & 400 years for one centimeter of topsoil to form.

Soil Composition

Loss of topsoil can be caused when plants roots are no longer present to hold down soil. Salting
