Weld Cracking In Ferrous Alloys:

Weld Cracking in Ferrous Alloys R Singh, 2008-12-12 Weld cracks are unacceptable defects that can compromise the integrity of welded structures. Weld cracking can lead to structural failures which at best will require remedial action and at worst can lead to loss of life. Weld cracking in ferrous alloys reviews the latest developments in the design, evaluation, prevention and repair of weld cracks. Part one reviews the fundamentals as well as recent advances in the areas of welding technology, design and material selection for preventing weld cracking. Part two analyses weld crack behaviour, evaluation and repair of cracking cracked welds. The book benefits from an extensive and robust chapter on the topic of NDE and quality control that was contributed by one of the most respected non-destructive evaluation and development groups in the world. Part three covers environment assisted weld cracking. With its distinguished editor and international team of contributors, Weld cracking in ferrous alloys is a valuable source of reference for all those concerned with improving the quality of welding and welded components. In the planning and development of this book particular care has been taken to make the chapters suitable for people from other disciplines who need to understand weld cracking and failure. Reviews the latest developments in the design, evaluation, prevention and repair of weld cracks. Assesses recent advances in welding technology, design and material selection. Analyses weld crack behaviour, evaluation and repair including environment assisted weld cracking.

Hot Cracking Phenomena in Welds II Thomas Böllinghaus, Horst Herold, Carl E. Cross, J C Lippold, 2008-08-07 Failure of welded components can occur during service as well as during fabrication. Most common analyses of the resistance of welded components against failure are targeted at crack avoidance. Such evaluations are increasingly carried out by modern weldability studies i.e. considering interactions between the selected base and filler materials, structural design and welding process. Such weldability investigations are particularly targeted to prevent hot cracking as one of the most common cracking phenomena occurring during weld fabrication. To provide an international information and discussion platform to combat hot cracking, an international workshop on Hot Cracking Phenomena in Welds has been created based on an initiative of the Institute for Materials and Joining Technology at the Otto von Guericke University in Magdeburg and the Division V 5 Safety of Joined Components at the Federal Institute for Materials Research and Testing BAM in Berlin, Germany. The first workshop was organized in Berlin under the topics mechanisms and phenomena, metallurgy and materials, modelling and simulations as well as testing and standardization. It consisted of 20 individual contributions from eight countries which were compiled in a book that found a very ready market not only in the welding community. As a consequence of increasing interest it has been decided to establish the Workshop on Hot Cracking Phenomena in Welds as a regular event every three years embedded in the International Institute of Welding IIW. Attached to the IIW Commission IX and II Spring intermediate meetings the second workshop was organized in March 2007. Failure Mechanisms of Advanced Welding Processes X Sun, 2010-07-15 Many new or relatively new welding processes such as friction stir welding, resistance spot welding and laser welding are being

increasingly adopted to replace or improve on traditional welding techniques. Before advanced welding techniques are employed their potential failure mechanisms should be well understood and their suitability for welding particular metals and alloys in different situations should be assessed. Failure mechanisms of advanced welding processes provides a critical analysis of advanced welding techniques and their potential failure mechanisms. The book contains chapters on the following topics: Mechanics modelling of spot welds under general loading conditions and applications to fatigue life predictions; Resistance spot weld failure mode and weld performance for aluminium alloys, dual phase steels and TRIP steels; Fatigue behaviour of spot welded joints in steel sheets; Non destructive evaluation of spot weld quality; Solid state joining fundamentals of friction stir welding; Failure mechanisms in friction stir welds; Microstructure characteristics and mechanical properties of laser weld bonding of magnesium alloy to aluminium alloy; Fatigue in laser welds; Weld metal ductility and its influence on formability of tailor welded blanks; Joining of lightweight materials using reactive nanofoils; and Fatigue life prediction and improvements for MIG welded advanced high strength steel weldments. With its distinguished editor and international team of contributors, Failure mechanisms of advanced welding processes is a standard reference text for anyone working in welding and the automotive, shipbuilding, oil and gas and other metal fabrication industries who use modern and advanced welding processes. Provides a critical analysis of advanced welding techniques and their potential failure mechanisms. Experts in the field survey a range of welding processes and examine reactions under various types of loading conditions. Examines the current state of fatigue life prediction of welded materials and structures in the context of spot welded joints and non destructive evaluation of quality.
