

Steven Weinberg (1933–2021)

This is a homage to the memory of Prof. Steven Weinberg who passed away on 23 July 2021. The world of theoretical particle physics is the poorer because of it and feels a great sense of loss. Both of the authors are among the large worldwide community of physicists and astrophysicists who have spent their lifetime working in the areas pioneered by him. He dominated the world of theoretical particle physics from the sixties to eighties, with an amazing breadth of the subjects which he contributed to and an equally amazing depth of these contributions. The only other theorist with comparable breadth of interests in the period was his colleague at the University of Texas at Austin (UT), the Indian physicist: late E. C. G. Sudharshan. Weinberg's idea of the unified description of the electromagnetic and weak interactions (the EW unification), announced in a three-page paper titled 'A model of leptons', is at the centre of the Standard Model (SM) of Particle Physics, a cornerstone of our understanding of fundamental laws of Nature that govern the world of elementary particles. It is in fact now an integral part of the journey of science and scientists to arrive at a basic understanding of the Cosmos and the Universe. In fact, the SM has driven experimental particle physics for six decades. However, it needs to be noted that his work on the EW theories for which he was awarded the Nobel prize (along with Sheldon Glashow and Abdus Salam) in 1979 and which became well known in the world of non-scientists as well since the discovery of the Higgs boson at the Large Hadron Collider (LHC), is just one part of the vast vista of his contributions to particle physics and cosmology.

This giant of 20th century theoretical physics, was born in New York city in 1933 to immigrant parents. He was the first one from his family to go to college. He praised the Bronx High School for Science which he attended for the atmosphere if not for the subjects they taught. He described his time there as cool, where the co-students looked up to the smart students who learnt many topics in science and mathematics, not taught in the school, on their own. (Incidentally 7 pupils from this school went on to become Nobel Laureates, Steven Weinberg, Sheldon Glashow, Melvin Schwarz, Roy Glauber and H. David Politzer to name a few.) According to him, he simply loved the ability to calcu-

late things. He was thrilled when he could calculate the catenary shape of cables in a suspension bridge, though he wanted to move forward from just having fun in solving problems where the solutions were known.

After finishing school, he obtained his bachelor's degree at Cornell University in 1954. After spending one year at Copenhagen at the Niels Bohr Institute he joined Princeton University. It is this one year in Copenhagen where he began doing independent research on a small problem

suggested by Gunnar Källén. It is this experience that was behind his advice to young people, given much later at the graduation address at McGill University: 'You don't have to know everything because I didn't when I got my PhD'. He advised young people to learn things on the job as it were, as one goes along working on the subject!

After finishing his Ph.D. in 1957 under the supervision of Sam Treiman at Princeton University, he moved as a postdoctoral research fellow, first to Columbia University and then to the University of California, Berkeley in 1959. He stayed there till 1966 as faculty during which period he worked on a broad canvas of Quantum Field Theory, its version called Effective Field theory (EFT), and Gravitation. In 1966 he moved to Boston, holding positions at MIT and later at Harvard, where his wife was studying for her law degree. He says in an interview 'a lot of my thinking was done while sitting on the park benches and watching my daughter play'. Around 1979 Weinberg and Mrs Louise Weinberg (nee Goldwasser), professor of law at Harvard started exploring to move to another University. He began to teach at UT as early as Spring of 1980 and formally became Josey Regental Professor in the Departments of Physics as well as Astronomy by 1982. In his arrival at UT, he added even more to the very high profile it

already had, with stalwarts Ilya Prigogine, John A. Wheeler, Bryce de Witt and E. C. G. Sudarshan being present there. L. Weinberg became a professor in the UT School of Law, a position which she holds till date.

The late fifties and early sixties was a time of great confusion in the world of theoretical particle physics. Experimental particle physics was way ahead of the theories, producing information on various aspects of the world of hadrons (n, p, pions, kaons, ...) involving the strong and the weak interactions. In the case of strong interactions there were many models which could be constructed to describe the same but none of them had any predictive power due to the large strength of the interaction which made perturbative calculations impossible. For the weak interactions one had a generalization of Fermi's theory in the form of 'V-A' theory of E. C. G. Sudarshan and R. E. Marshak, also proposed by R. P. Feynman and M. Gell-Mann, which by itself had provided a substantial order in the world of weak interactions. But unfortunately, this theory stopped making any sense at high energies. Weinberg made pioneering, all important contributions which brought order in both these areas. The one in the context of weak interactions was the above-mentioned EW unification and the construction of 'A model of leptons'. This paper written in 1967, when he was a visiting professor at MIT, is the highest cited paper in Particle Physics ever. The work in the context of strong interactions provided a way to expand the amplitudes in inverse power of energy rather than powers of the strong coupling. This goes by the name of Effective Field Theories (EFT). In fact, in view of the lack of any hint of a new particle or interactions at the LHC so far, the EFT methods have emerged once again as frontline tools to probe the physics of interactions and/or particles beyond those in the SM (BSM physics), at the LHC and otherwise. It has also led to formalism of the Soft-collinear Effective Theories (SCET) which is used to compute quantities of interest in theories with widely different scales. In fact, it finds applications in Condensed Matter Physics as well.

Weinberg along with Goldstone and Abdus Salam had been worrying about the famous phenomenon of spontaneous symmetry breaking. But as he himself said in a
