- ***Spread-spectrum*** is a transmission technique in which a ***pseudo-noise code***, independent of the information data, is employed as a modulation wave form to spread the signal energy over a bandwidth much greater than the signal information band width.
- At the receiver the signal is ***“despread”*** using a synchronized replica of the pseudo-noise code.
- This pseudo-random code is also called ***chipping sequence*** or ***key***.
- The most practical and dominant methods of spread-spectrum communications are direct-sequence modulation and frequency hopping of digital communications.
- Next we will see each one by one in detail.
