Physical Database Design in Multiprocessor Database Systems Shahram Ghandeharizadeh, 1990 Abstract In shared nothing multiprocessor database machines relations are horizontally declustered across multiple processors in order to obtain a lower response time and a higher throughput from the system Several alternative strategies exist for horizontally declustering a relation However the performance tradeoffs of these declustering strategies with respect to the different storage and access structures have not been previously examined Thus a database administrator for such a system has no choice but to guess how many processors a relation should be clustered across and what declustering strategy is most appropriate
