*Core Values: the Role of Core in Twenty-first Century Reservoir Characterization* A. Neal, M. Ashton, L.S. Williams, S.J. Dee, T.J.H. Dodd, J.D. Marshall, 2023-11-21 Deep subsurface characterization technologies and demands are changing rapidly within the energy industry In this swiftly evolving landscape the wide range of analyses performed on the rocks and fluids obtained from cores remain fundamental tools in managing subsurface uncertainty and associated risk During the energy transition large volumes of newly acquired and legacy core will be accessed to better understand both existing hydrocarbon resources and other subsurface energy related systems particularly for carbon capture utilization and storage CCUS geothermal energy and the long term storage of nuclear waste Through state of the art reviews and case studies this volume illustrates how innovative approaches continue to create value from both new and historical cores recovered for deep subsurface reservoir characterization and storage complex evaluation Such an assessment is timely given that the sector sits at a pivotal point in terms of changing technologies economics demographics skillsets and energy solutions

*Marine Microbiomes: Towards Standard Methods and Best Practices* Stéphane Pesant, Kelly D. Goodwin, Catarina Magalhães, Anaïs Lacoursière-Roussel, 2023-12-14 A decade of technological advances and research on the human microbiome has re defined our understanding of biological systems and now offers diagnostic tools and new approaches to human health Likewise marine ecosystems are driven by their microbiome the ensemble of microscopic organisms that inhabit the water column sediments and aquatic organisms and regulate most fluxes of energy and matter While the human microbiome is composed principally of bacteria the marine microbiome has a much broader ensemble of microscopic organisms with sizes spanning from viruses of a few tens of nanometres to metazoans of several centimetres Advances in high throughput imaging and sequencing are emerging in aquatic science providing important insights into ecosystem structure and functions and contributing to develop new indicators of ecosystem health and potential hazards to living resources and humans A number of research exploration and monitoring programs such as the Tara Oceans global expedition and the Marine Biological Observing Network MBON and the rising popularity of environmental DNA eDNA already led to a wealth of data However the wide range of methodologies used in this early exploration phase poses a challenge to integrative studies prompting community responses such as the Genomic Standards Consortium This Research Topic will foster cross community exchange of standards and best practices It is an opportunity for the different communities working on marine microbiomes to discuss the advantages and the limitations of their sampling and analysis methods The collection of papers will constitute a knowledge base aimed at 1 addressing the

integration of existing observations from heterogeneous methods and data types and 2 working towards cross communities standards and best practices for future observations and experiments This Research Topic will publish comprehensive methodological papers that review a sufficiently large body of field or experimental work Supporting meta data such as environmental context sampling materials sample treatments extraction and imaging yields must be provided and should preferably be uploaded to an online sample registry such as BioSamples Protocols and analytical methods should preferably be uploaded to an online repository such as Protocols.io We welcome contributions from communities working in different environments focus on marine systems but also interested in estuarine and freshwater systems coastal open ocean and deep sea regions benthic pelagic and aerosol environments We strongly encourage contributions from communities involved in networks of local observatories and long term monitoring programs regional basin scale surveys and global expeditions biodiversity linked to economic sectors such as pharmaceuticals and bioengineering environmental and health assessments linked to economic sectors such as aquaculture fisheries seabed mining wind farms and oil and gas

Committee on Armed Services, 2002 *Deep Subsurface Microbiology* Andreas Teske, Jennifer F. Biddle, Virginia P. Edgcomb, Axel Schippers, 2015-07-01 Deep subsurface microbiology is a highly active and rapidly advancing research field at the interface of microbiology and the geosciences it focuses on the detection identification quantification cultivation and activity measurements of bacteria archaea and eukaryotes that permeate the subsurface biosphere of deep marine sediments and the basaltic ocean and continental crust The deep subsurface biosphere abounds with uncultured only recently discovered and at best incompletely understood microbial populations In spatial extent and volume Earth's subsurface biosphere is only rivaled by the deep sea water column So far no deep subsurface sediment has been found that is entirely devoid of microbial life microbial cells and DNA remain detectable at sediment depths of more than 1 km microbial life permeates deeply buried hydrocarbon reservoirs and is also found several kilometers down in continental crust aquifers Severe energy limitation either as electron acceptor or donor shortage and scarcity of microbially degradable organic carbon sources are among the evolutionary pressures that have shaped the genomic and physiological repertoire of the deep subsurface biosphere Its biogeochemical role as long term organic carbon repository inorganic electron and energy source and subduction recycling engine continues to be explored by current research at the interface of microbiology geochemistry and biosphere geosphere evolution This Research Topic addresses some of the central research questions about deep subsurface microbiology and biogeochemistry phylogenetic and physiological microbial diversity in the deep subsurface microbial activity and survival strategies in severely energy limited subsurface habitats microbial activity as reflected in process rates and gene expression patterns biogeographic isolation and connectivity in deep subsurface microbial communities the ecological standing of subsurface biospheres in comparison to the surface biosphere an independently flourishing biosphere or mere survivors that

tolerate burial along with organic carbon compounds or a combination of both Advancing these questions on Earth s deep subsurface biosphere redefines the habitat range environmental tolerance activity and diversity of microbial life
