

Unit (3) Electricity and Magnetism

Chapter (11): Static Electricity

11.2: Electric Charge:

- **Like Charges repel.**
- **Unlike Charges attract.**
- **The force decreases as distance between charges increases.**

Everything is made of tiny particles called atoms. These have electric charge inside them. A simple model of the atom is shown on the right. There is a central nucleus made of Protons and Neutrons. And orbiting the nucleus there are much lighter particles called Electrons:

- Electrons have a negative charge (-).
- Protons have an equal positive charge (+).
- Neutrons carry no charge and are said to be "neutral".

★ • **A positively charged object is an object that has lost electrons.**

★ • **A negatively charged object is an object that has gained extra electrons.**

Note: only electrons (negative charges) are able to move because protons are held in place at the nucleus.

11.3: Conductors and Insulators:

Conductors are materials that let electrons pass through them. **Metals** are the best electrical conductors. This is because some of the electrons are loosely held to their atoms and are called "free electrons".

Insulators are materials that hardly conduct at all. Their electrons are held tightly to atoms and are not free to move - although they can be transferred by rubbing. (eg: wood, plastic and air)

11.4: Methods of Charging a Body:

11.4.1 Charging by rubbing (friction charging):

Classical Electromagnetic

Radiation, Third Edition Mark A. Heald, Jerry B. Marion, 2013-04-22 This newly corrected, highly acclaimed text offers
intermediate level juniors and first year graduate students of physics a rigorous treatment of classical electromagnetics. The
authors present a very accessible, macroscopic view of classical electromagnetics that emphasizes integrating

electromagnetic theory with physical optics The survey follows the historical development of physics culminating in the use of four vector relativity to fully integrate electricity with magnetism Starting with a brief review of static electricity and magnetism the treatment advances to examinations of multipole fields the equations of Laplace and Poisson dynamic electromagnetism electromagnetic waves reflection and refraction and waveguides Subsequent chapters explore retarded potentials and fields and radiation by charged particles antennas classical electron theory interference and coherence scalar diffraction theory and the Fraunhofer limit Fresnel diffraction and the transition to geometrical optics and relativistic electrodynamics A basic knowledge of vector calculus and Fourier analysis is assumed and several helpful appendices supplement the text An extensive Solutions Manual is also available **Textbook of Oral Radiology** Ghom,2009-11-23
