## **Statistical Models Of Shape Optimisation And Evaluation:**

*Statistical Models of Shape* Rhodri Davies, Carole Twining, Chris Taylor, 2008-12-15 The goal of image interpretation is to convert raw image data into meaningful information. Images are often interpreted manually. In medicine for example a radiologist looks at a medical image, interprets it and translates the data into a clinically useful form. Manual image interpretation is however a time consuming, error prone and subjective process that often requires specialist knowledge. Automated methods that promise fast and accurate image interpretation have therefore stirred up much interest and have become a significant area of research activity. Early work on automated interpretation used low level operations such as edge detection and region growing to label objects in images. These can produce reasonable results on simple images, but the presence of noise, occlusion and structural complexity often leads to erroneous labelling. Furthermore, labelling an object is often only the first step of the interpretation process. In order to perform higher level analysis, a priori information must be incorporated into the interpretation process. A convenient way of achieving this is to use a flexible model to encode information such as the expected size, shape, appearance and position of objects in an image. The use of flexible models was popularized by the active contour model or 'snake'. A snake deforms so as to match image evidence e.g. edges, whilst ensuring that it satisfies structural constraints. However, a snake lacks specificity as it has little knowledge of the domain, limiting its value in image interpretation.

**Handbook of Pattern Recognition and Computer Vision (5th Edition)** Chi-hau Chen, 2015-12-15 The book provides an up to date and authoritative treatment of pattern recognition and computer vision with chapters written by leaders in the field. On the basic methods in pattern recognition and computer vision, topics range from statistical pattern recognition to array grammars to projective geometry to skeletonization and shape and texture measures. Recognition applications include character recognition and document analysis, detection of digital mammograms, remote sensing, image fusion and analysis of functional magnetic resonance imaging data, etc.

*Feature Extraction and Image Processing for Computer Vision* Mark Nixon, Alberto Aguado, 2025-09-22 Feature Extraction and Image Processing for Computer Vision, Fifth Edition is an essential guide to the implementation of image processing and computer vision techniques with tutorial introductions and sample code in MATLAB and Python. Algorithms are presented and fully explained to enable complete understanding of the methods and techniques demonstrated, providing a link between theory and implementation. Essential background theory is carefully explained. This text gives students and researchers in image processing and computer vision a complete introduction to classic and state of the art methods in feature extraction, together with practical guidance on their implementation. Concentrates on feature extraction with working implementation and worked through mathematical derivations and algorithmic methods. Provides a thorough overview of available feature extraction methods, including essential background theory, shape, methods, texture and deep learning. Includes up to date coverage of interest point detection, feature extraction and description, and image representation, including frequency domain and color. Includes a good

balance between providing a mathematical background and practical implementation
