**Statistics, Testing, and Defense Acquisition** National Research Council, Division of Behavioral and Social Sciences and Education, Commission on Behavioral and Social Sciences and Education, Panel on Statistical Methods for Testing and Evaluating Defense Systems, 1999-08-17 The Panel on Statistical Methods for Testing and Evaluating Defense Systems had a broad mandate to examine the use of statistics in conjunction with defense testing. This involved examining methods for software testing, reliability test planning and estimation, validation of modeling and simulation, and use of modern techniques for experimental design. Given the breadth of these areas, including the great variety of applications and special issues that arise, making a contribution in each of these areas required that the Panel's work and recommendations be at a relatively general level. However, a variety of more specific research issues were either brought to the Panel's attention by members of the test and acquisition community e.g. what was referred to as Dubin's challenge addressed in the Panel's interim report or were identified by members of the panel. In many of these cases the panel thought that a more in-depth analysis or a more detailed application of suggestions or recommendations made by the Panel would either be useful as input to its deliberations or could be used to help communicate more individual views of members of the Panel to the defense test community. This resulted in several research efforts. Given various criteria, especially immediate relevance to the test and acquisition community, the Panel has decided to make available three technical or background papers, each authored by a Panel member jointly with a colleague. These papers are individual contributions and are not a consensus product of the Panel; however, the Panel has drawn from these papers in preparation of its final report, Statistics Testing and Defense Acquisition. The Panel has found each of these papers to be extremely useful and they are strongly recommended to readers of the Panel's final report.

Faltin, 2018-06-20 A comprehensive treatment of systems and software testing using state of the art methods and tools. This book provides valuable insights into state of the art software testing methods and explains with examples the statistical and analytic methods used in this field. Numerous examples are used to provide understanding in applying these methods to real world problems. Leading authorities in applied statistics, computer science and software engineering present state of the art methods addressing challenges faced by practitioners and researchers involved in system and software testing. Methods include machine learning, Bayesian methods, graphical models, experimental design, generalized regression and reliability modeling. *Analytic Methods in Systems and Software Testing* presents its comprehensive collection of methods in four parts: Part I Testing Concepts and Methods, Part II Statistical Models, Part III Testing Infrastructures and Part IV Testing Applications. It seeks to maintain a focus on analytic methods while at the same time offering a contextual landscape of modern engineering in order to introduce related statistical and probabilistic models used in this domain. This makes the book an incredibly useful tool offering interesting insights on challenges in the field for researchers and practitioners alike.
