Hassan,2011 Mobile communication has become an essential part of our daily life We love the flexibility of wireless cell phones and even accept their lower quality of service when compared to wired links Similarly we are looking forward to the day that we can continue watching our favorite TV programs while travelling anywhere and everywhere including satellite channels and the wish list goes on Mobility flexibility and portability are the themes of the next generation communication Motivated and fascinated by such technology breakthroughs this effort is geared towards enhancing the quality of wireless services and bringing mobile satellite reception one step closer to the market On the other hand phased array antennas are vital components for RADAR applications where the antenna is required to have certain scan capabilities One of the main concerns in that perspective is how to avoid the potential of scan blindness in the required scan range Targeting to achieve wideband wide scan angle phased arrays free from any scan blindness our efforts is also geared Conventionally the key to lower the profile of the antenna is to use planar structures In that perspective microstrip patch antennas have drawn the attention of antenna engineers since the 1970s due to their attractive features of being low profile compact size light weight and amenable to low cost PCB fabrication processes However patch elements are basically resonating at a single frequency

Due to high demand for planar structures with low loss a considerable amount of research has been done to the design of substrate integrated waveguide SIW components in the mm wave and microwave range SIW has many advantages in comparison to conventional waveguides and microstrip lines such as compact and planar structure ease of fabrication low radiation loss high power handling ability and low cost which makes it a very promising technology for current and future systems operating in K band and above Therefore all the work presented in this dissertation focuses on SIW technology Five different antenna systems are proposed to verify the advantages of using SIW technology First a novel K band end re SIW circularly polarized CP antenna system on a single layer printed circuit board is proposed A high gain SIW H plane horn and a Vivaldi antenna are developed to produce two orthogonal polarizations in the plane of the substrate CP antennas have become very popular because of their unique characteristics and their applications in satellites radars and wireless communications Second a K band front end system for tracking applications is presented The circuit comprises an antenna array of two Vivaldi antennas a frequency selective power combiner and two frequency selective SIW crossovers which eliminate the need for subsequent filtering The integration of monopulse systems in planar printed circuit SIW technology combined with the added benefits of filtering functions is of great importance to the antennas and propagation community Third a phased array antenna system consisting of 24 radiating element is designed as feed system for reflector antennas in radio astronomy applications A Ku band antipodal dipole antenna with wide bandwidth low cross polarization and wide beamwidth is suggested as the radiating element Forth four different right angled power dividers including in phase and out of phase dividers as feed systems for antenna arrays are introduced TE₁₀ to TE_{q0} mode transducers are used for obtaining two three and four output dividers with phase control ability at K and Ka band This feature is practical for instance when designing tracking systems since they are employed to obtain controllable phase distributions over the output ports Fifth a Ku band beam steering antenna system which is applicable to use for wireless communications radar systems and also 5G applications is proposed This antenna system uses variable reflection type phase shifters which electrically steer the beam over a 50 degree scan range Therefore the SIW technology's reliability and also promising behavior in the microwave frequency range is proven for different applications
