Salomaa,2003-08-01 This book presents state of the art research in theoretical computer science and related fields In particular the following areas are discussed automata theory formal languages and combinatorics of words graph transformations Petri nets concurrency as well as natural and molecular computing The articles are written by leading researchers in these areas The writers were originally invited to contribute to this book but then the normal refereeing procedure was applied as well All of the articles deal with some issue that has been under vigorous study during recent years Still the topics range from very classical ones to issues raised only two or three years ago Both survey articles and papers attacking specific research problems are included The book highlights some key issues of theoretical computer science as they seem to us now at the beginning of the new millennium Being a comprehensive overview of some of the most active current research in theoretical computer science it should be of definite interest for all researchers in the areas covered The topics range from basic decidability and the notion of information to graph grammars and graph transformations and from trees and traces to aqueous algorithms DNA encoding and self assembly Special effort has been given to lucid presentation Therefore the book should be of interest also for advanced students

**Jumping Computation** Alexander Meduna,Zbyněk Křivka,2024-03-07 Jumping Computation Updating Automata and Grammars for Discontinuous Information Processing is primarily a theoretically oriented treatment of jumping automata and grammars covering all essential theoretical topics concerning them including their power properties and transformations From a practical viewpoint it describes various concepts methods algorithms techniques case studies and applications based upon these automata and grammars In today's computerized world the scientific development and study of computation referred to as the theory of computation plays a crucial role One important branch language theory investigates how to define and study languages and their models which formalize algorithms according to which their computation is executed These language defining models are classified into two basic categories automata which define languages by recognizing their words and grammars which generate them Introduced many decades ago these rules reflect classical sequential computation However today's computational methods frequently process information in a fundamentally

different way frequently jumping over large portions of the information as a whole This book adapts classical models to formalize and study this kind of computation properly Simply put during their language defining process these adapted versions called jumping automata and grammars jump across the words they work on The book selects important models and summarizes key results about them in a compact and uniform way It relates each model to a particular form of modern computation such as sequential semi parallel and totally parallel computation and explains how the model in question properly reflects and formalizes the corresponding form of computation thus allowing us to obtain a systematized body of mathematically precise knowledge concerning the jumping computation The book pays a special attention to power closure properties and transformations and also describes many algorithms that modify jumping grammars and automata so they satisfy some prescribed properties without changing the defined language The book will be of great interest to anyone researching the theory of computation across the fields of computer science mathematics engineering logic and linguistics
