David Rex Hina,2000-09-01 This thesis evaluates the application of current Extensible Markup Language XML tools and technologies toward solving data interoperability issues between legacy data repositories Past efforts to address these issues have largely failed XML has the capability to address many of the past problems but this can only be accomplished when the supporting COTS tools and technologies are available The thesis first establishes the underlying issues that need to be addressed It then evaluates the current state of technologies and COTS products and describes the advantages and disadvantages of each Finally it focuses in on the schema for a specific relational database demonstrates a process by which data exchange can be implemented and outlines the issues remaining to be solved

**XML Databases and the Semantic Web** Bhavani Thuraisingham,2002-03-27 Efficient access to data sharing data extracting information from data and making use of the information have become urgent needs for today's corporations With so much data on the Web managing it with

conventional tools is becoming almost impossible. New tools and techniques are necessary to provide interoperability as well as warehousing between [Relational and XML Data Exchange](#) Marcelo Arenas, 2010. Data exchange is the problem of finding an instance of a target schema given an instance of a source schema and a specification of the relationship between the source and the target. Such a target instance should correctly represent information from the source instance under the constraints imposed by the target schema and it should allow one to evaluate queries on the target instance in a way that is semantically consistent with the source data. Data exchange is an old problem that has re-emerged as an active research topic recently due to the increased need for exchange of data in various formats often in e-business applications. In this lecture we give an overview of the basic concepts of data exchange in both relational and XML contexts. We give examples of data exchange problems and we introduce the main tasks that need to be addressed. We then discuss relational data exchange concentrating on issues such as relational schema mappings, materializing target instances including canonical solutions and cores, query answering and query rewriting. After that we discuss metadata management, i.e. handling schema mappings themselves. We pay particular attention to operations on schema mappings such as composition and inverse. Finally we describe both data exchange and metadata management in the context of XML. We use mappings based on transforming tree patterns and we show that they lead to a host of new problems that did not arise in the relational case but they need to be addressed for XML. These include consistency issues for mappings and schemas as well as imposing tighter restrictions on mappings and queries to achieve tractable query answering in data exchange.

Special Features: Wrox XML is becoming the key standard for transferring data between databases and two and from the web replacing proprietary methods. XML is supported by all major databases. Takes a beginning approach assuming the reader has not done a lot of work with XML and databases which most readers won't have done at this point. About The Book: Written in the well known and successful Wrox Beginning and format with numerous hands on step by step examples. Beginning XML Databases shows web developers how to simplify their database work with XML. It also works for database programmers trying to find simpler more standard ways to exchange data between multiple databases either internally or with external customers and partners. Some of the topics covered include: Scripting database servers with XML and popular languages including ASP.NET, PHP and Perl; Using XML to work with data tables in Oracle.

**Internet-based Data Exchange** Amit Kumar S B. Vyas,2001 [XML Based Manipulation of Codes Exchanged Between Data Systems](#) ,2003

Codes are an abbreviated form of information often found in many databases. For most databases the codes are developed specifically for the local database processing system. In a data sharing environment the specific code development results in different database systems referring to similar data using different codes. Conversion of codes is required when these systems share data. eXtensible Markup Language XML is well suited to transferring the content structure of databases between different platforms. This paper explores the transfer of coded information between databases. Examples presented in the paper use two developed XML languages to define the structures for the data the code dictionaries. The data structure contains coded information that uses the codes in the data provider's database. Example mappings between the provider's code set and the receiver's code set are created using a map of code equivalents. The mapping is performed using eXtensible Stylesheet Language Transformations XSLT which has been developed from XML and is a language designed to restructure present the content of XML documents.
