Handbook of Survival Analysis John P. Klein, Hans C. van Houwelingen, Joseph G. Ibrahim, Thomas H. Scheike, 2016-04-19 Handbook of Survival Analysis presents modern techniques and research problems in lifetime data analysis This area of statistics deals with time to event data that is complicated by censoring and the dynamic nature of events occurring in time With chapters written by leading researchers in the field the handbook focuses on advances in survival analysis techniques covering classical and Bayesian approaches It gives a complete overview of the current status of survival analysis and should inspire

further research in the field Accessible to a wide range of readers the book provides An introduction to various areas in survival analysis for graduate students and novices A reference to modern investigations into survival analysis for more established researchers A text or supplement for a second or advanced course in survival analysis A useful guide to statistical methods for analyzing survival data experiments for practicing statisticians

Statistical Methods on Survival Data with Measurement Error Ying Yan, University of Waterloo. Department of Statistics and Actuarial Science, 2014 In survival data analysis covariates are often subject to measurement error A naive analysis with measurement error ignored commonly leads to biased estimation of parameters of survival models Measurement error also causes efficiency loss for detecting possible association between risk factors and time to event Furthermore it induces difficulty on model building and model checking because the presence of measurement error frequently masks true underlying patterns of data Although there has been a large body of literature to handle error prone survival data since the paper by Prentice 1982 many important issues still remain unexplored in this area This thesis focuses on several important issues of survival analysis with covariate measurement error One problem that has received little attention is on misspecification of measurement error models In this thesis we investigate this important problem with the attention particularly paid to error contaminated survival data under the Cox model In particular we conduct bias analysis which offers a way to unify many existing methods of survival data with measurement error and study the impact of misspecifying the error models in survival data analysis A simple expression is obtained to quantify the bias of working estimators derived under misspecified error models Consistent estimators under general error models are derived based on this simple expression Furthermore we study hypothesis testing with both model misspecification and measurement error present A second problem of our interest is about the validity of survival model assumptions when measurement error is involved In the literature a large number of methods have been developed to correct for measurement error effects and these methods basically assume the survival model to be the Cox model When the Cox model or the error model assumptions fail to hold existing methods would break down In this thesis we address the issue of checking the Cox model assumptions with measurement error We propose valid goodness of fit tests for survival data with covariate measurement error This research offers us an important addition to the literature of survival data with measurement error Our third topic concerns survival data analysis under additive hazards models with covariate measurement error The additive hazards model is a useful and important alternative to the Cox model However this model is relatively less studied for situations where covariates are measured with error In this thesis we make important contributions to this topic Specifically we explore asymptotic bias induced from ignoring measurement error A number of inference methods are developed to correct for error effects The validity of the proposed methods is justified both theoretically and empirically We investigate issues of model checking and model misspecification as well In many studies collection of data often includes a large number of variables in which many of them are unimportant in explaining survival of an individual An

important task is thus to identify relevant risk factors which are linked to the hazards of subjects. Although there is work on variable selection for survival data analysis, the available methods typically require all variables be precisely measured. This requirement is however often infeasible. More challengingly, in some studies the dimension of the risk factors can be quite large or even much larger than the size of subjects. Our fourth topic concerns about estimation and variable selection for survival data with high dimensional mismeasured covariates. We propose corrected penalized methods. Our methods can adjust for measurement error effects and perform estimation and variable selection simultaneously. Our research on this topic closes multiple gaps among the areas of survival analysis, measurement error, and variable selection. **Statistical Methods**

for Survival Data Analysis, 1998 **Analysis of Survival Data** D.R. Cox, David Oakes, 2018-02-19 This monograph contains many ideas on the analysis of survival data to present a comprehensive account of the field. The value of survival analysis is not confined to medical statistics where the benefit of the analysis of data on such factors as life expectancy and duration of periods of freedom from symptoms of a disease as related to a treatment applied, individual histories, and so on is obvious. The techniques also find important applications in industrial life testing and a range of subjects from physics to econometrics. In the eleven chapters of the book, the methods and applications of are discussed and illustrated by examples.

Survival Analysis Prabhanjan Narayanachar Tattar, H J Vaman, 2022-08-26 Survival analysis generally deals with analysis of data arising from clinical trials. Censoring, truncation, and missing data create analytical challenges, and the statistical methods and inference require novel and different approaches for analysis. Statistical properties, essentially asymptotic ones of the estimators and tests, are aptly handled in the counting process framework which is drawn from the larger arm of stochastic calculus. With explosion of data generation during the past two decades, survival data has also enlarged, assuming a gigantic size. Most statistical methods developed before the millennium were based on a linear approach, even in the face of complex nature of survival data. Nonparametric nonlinear methods are best envisaged in the Machine Learning school. This book attempts to cover all these aspects in a concise way. Survival Analysis offers an integrated blend of statistical methods and machine learning, useful in analysis of survival data. The purpose of the offering is to give an exposure to the machine learning trends for lifetime data analysis. Features: Classical survival analysis techniques for estimating statistical functional and hypotheses testing. Regression methods covering the popular Cox relative risk regression model, Aalen's additive hazards model, etc. Information criteria to facilitate model selection, including Akaike, Bayes, and Focused Penalized methods. Survival trees and ensemble techniques of bagging, boosting, and random survival forests. A brief exposure of neural networks for survival data. R program illustration throughout the book. **Applied Survival Analysis Using R** Dirk F. Moore, 2016-05-11 Applied Survival Analysis Using R covers the main principles of survival analysis, gives examples of how it is applied, and teaches how to put those principles to use to analyze data using R as a vehicle. Survival data, where the primary outcome is time to a specific event, arise in many areas of biomedical research, including clinical trials, epidemiological studies,

and studies of animals Many survival methods are extensions of techniques used in linear regression and categorical data while other aspects of this field are unique to survival data This text employs numerous actual examples to illustrate survival curve estimation comparison of survivals of different groups proper accounting for censoring and truncation model variable selection and residual analysis Because explaining survival analysis requires more advanced mathematics than many other statistical topics this book is organized with basic concepts and most frequently used procedures covered in earlier chapters with more advanced topics near the end and in the appendices A background in basic linear regression and categorical data analysis as well as a basic knowledge of calculus and the R system will help the reader to fully appreciate the information presented Examples are simple and straightforward while still illustrating key points shedding light on the application of survival analysis in a way that is useful for graduate students researchers and practitioners in biostatistics
