Yon, 1995 Experimental and computational techniques are employed in an investigation of the evolution and behavior of distinct large scale structures in the separated flow field around a finite rectangular wing in high angle of attack orientations The experimental program includes model surface flow visualization mean loads and acquisition of both mean and unsteady static pressure data from the model surface and wake The computational simulation employs a two dimensional full Navier Stokes flow solver INS2D developed in the NAS Branch of NASA Ames in combination with the Baldwin Barth turbulence model Time accurate solution of the governing equations allows investigation of the unsteady structures within the separated flow field The mean and time dependent characteristics of the separated flow field suggest the existence of two distinct angle of attack regimes The shallow stall regime occurs over a narrow range of incidence angles 2 3 deg immediately following the inception of leading edge separation In this regime the principal mean flow structures termed stall cells are manifested as a distinct spanwise periodicity in the chordwise extent of the separated region on the model surface The cells are found to have a preferred lateral extent consistent with previous investigations and a distinct lateral mobility not previously reported The effects of cellular separation on the lift and drag characteristics of the wing are minimal The mean characteristics of the flow field associated with cellular separation are shown to be inconsistent with current models and a new model is proposed Within the stall cells large amplitude pressure fluctuations occur with a frequency much lower than anticipated for bluff body shedding These fluctuations are not associated with discrete spanwise vortices but appear to be related to a convective

instability in the upper surface shear layer The low frequency pressure fluctuations observed in the vicinity of the model surface do not extend into the far wake Both the stall cell and low frequency phenomena in the shallow stall regime may result from instabilities in the turbulent separated shear layer In the deep stall regime stall cells are not observed and the separated region near the model is relatively free of large amplitude pressure disturbances The numerical simulation suggests that the two regimes are distinguished by the presence in the shallow stall regime or absence in the deep stall regime of strong convecting vortex structures resulting from periodic accumulation of lower surface vorticity in the vicinity of the trailing edge

**International Tables for Crystallography, Volume F** Eddy Arnold, Daniel M. Himmel, Michael G. Rossmann, 2012-03-05 International Tables for Crystallography Volume F is an expert guide to macromolecular crystallography for the structural biologist It was commissioned by the International Union of Crystallography in recognition of the extraordinary contributions that knowledge of macromolecular structure has made and will make to the analysis of biological systems from enzyme catalysis to the workings of a whole cell The volume covers all stages of a crystallographic analysis from the preparation of recombinant proteins through crystallization diffraction data collection phase determination structure validation and structure analysis Although the volume is written for experienced scientists it is recognized that the reader is more likely to be a biologist interested in structure than a classical crystallographer interested in biology Thus there are chapters on the fundamentals history and current perspectives of macromolecular crystallography as well as on useful programs and databases such as the Protein Data Bank Each chapter is written by one or more internationally recognized experts This second edition features 19 new articles and many articles from the first edition have been revised The new articles cover topics such as standard definitions for quality indicators expression of membrane proteins protein engineering high throughput crystallography radiation damage merohedral twinning low resolution ab initio phasing robotic crystal loading whole cell X ray diffraction imaging and halogen interactions in biological crystal structures There are also new articles on relevant software including software for electron microscopy These enhancements will ensure that Volume F continues to be a key reference for macromolecular crystallographers and structural biologists More information on the series can be found at <http://it.iucr.org>
