

## Details of Mitosis

These diagrams show the detailed stages of mitosis. This cell has  $n = 2$ ; i.e. 2 pairs of homologous chromosomes.

### Interphase

- no chromosomes visible
- DNA, histones and centrioles all replicated

### Prophase

- chromosomes condensed and visible
- centrioles at opposite poles of cell
- nucleolus disappears

### Metaphase

- nuclear envelope disappears
- chromosomes align along equator of cell
- spindle fibres (microtubules) connect centrioles to chromosomes

### Anaphase

- centromeres split, allowing chromatids to separate
- chromatids move towards poles, centromeres first, pulled by motor proteins "walking" along the microtubule tracks

### Telophase

- spindle fibres disperse
- nuclear envelopes form
- chromatids uncoil and become too thin to see

### Cytokinesis

- In animal cells a ring of actin filaments forms round the equator of the cell, and then tightens to form a cleavage furrow, which splits the cell in two.

- In plant cells vesicles move to the equator, line up and fuse to form two membranes called the cell plate. A new cell wall is laid down between the membranes, which fuses with the existing cell wall.
