Subspace Identification For Linear Systems Theory Implementation Applications:

Subspace Identification for Linear Systems Peter van Overschee, B.L. de Moor, 2012-12-06 Subspace Identification for Linear Systems focuses on the theory implementation and applications of subspace identification algorithms for linear time invariant finite dimensional dynamical systems These algorithms allow for a fast straightforward and accurate determination of linear multivariable models from measured input output data The theory of subspace identification algorithms is presented in detail Several chapters are devoted to deterministic stochastic and combined deterministic stochastic subspace identification algorithms For each case the geometric properties are stated in a main subspace Theorem Relations to existing algorithms and literature are explored as are the interconnections between different subspace algorithms The subspace identification theory is linked to the theory of frequency weighted model reduction which leads to new interpretations and insights The implementation of subspace identification algorithms is discussed in terms of the robust and computationally efficient RQ and singular value decompositions which are well established algorithms from numerical linear algebra The algorithms are implemented in combination with a whole set of classical identification algorithms processing and validation tools in Xmath s ISID a commercially available graphical user interface toolbox The basic subspace algorithms in the book are also implemented in a set of Matlab files accompanying the book An application of ISID to an industrial glass tube manufacturing process is presented in detail illustrating the power and user friendliness of the subspace identification algorithms and of their implementation in ISID The identified model allows for an optimal control of the process leading to a significant enhancement of the production quality The applicability of subspace identification algorithms in industry is further illustrated with the application of the Matlab files to ten practical problems Since all necessary data and Matlab files are included the reader can easily step through these applications and thus get more insight in the algorithms Subspace Identification for Linear Systems is an important reference for all researchers in system theory control theory signal processing automation mechatronics chemical electrical mechanical and aeronautical engineering

Directions in Mathematical Systems Theory and Optimization Anders Rantzer, Christopher I. Byrnes, 2003-07-01 For more than three decades Anders Lindquist has delivered fundamental contributions to the fields of systems signals and control Throughout this period four themes can perhaps characterize his interests Modeling estimation and filtering feedback and robust control His contributions to modeling include seminal work on the role of splitting subspaces in stochastic realization theory on the partial realization problem for both deterministic and stochastic systems on the solution of the rational covariance extension problem and on system identification His contributions to filtering and estimation include the development of fast filtering algorithms leading to a nonlinear dynamical system which computes spectral factors in its steady state and which provide an alternate linear in the dimension of the state space to computing the Kalman gain from a matrix Riccati equation His further research on the phase portrait of this dynamical system gave a better understanding of when the Kalman filter will converge answering an open question raised by Kalman While still a student he established the separation principle for stochastic function differential equations including some fundamental work on optimal control for stochastic systems with time lags He continued his interest in feedback control by deriving optimal and robust control feedback laws for suppressing the effects of harmonic disturbances Moreover his recent work on a complete parameterization of all rational solutions to the Nevanlinna Pick problem is providing a new approach to robust control design

Automating Data-Driven Modelling of Dynamical Systems Dhruv Khandelwal, 2022-02-03 This book describes a user friendly evolutionary algorithms based framework for estimating data driven models for a wide class of dynamical systems including linear and nonlinear ones The methodology addresses the problem of automating the process of estimating data driven models from a user s perspective By combining elementary building blocks it learns the dynamic relations governing the system from data giving model estimates with various trade offs e g between complexity and accuracy The evaluation of the method on a set of academic benchmark and real word problems

is reported in detail Overall the book offers a state of the art review on the problem of nonlinear model estimation and automated model selection for dynamical systems reporting on a significant scientific advance that will pave the way to increasing automation in system identification
