*Precision Conservation* Jorge A. Delgado, Gretchen F. Sassenrath, Tom Mueller, 2020-01-22 Precision conservation is a reality and we are moving towards improved effectiveness of conservation practices by accounting for temporal and spatial variability within and off field. This is the first book to cover the application of the principles of precision conservation to target conservation practices across fields and watersheds. It has clearly been established that the 21st century will present enormous challenges from increased yield demands to climate change. Without improved conservation practices it will not be possible to ensure food security and conservation effectiveness. Readers will appreciate the application of the precision conservation concept to increase conservation effectiveness in a variety of contexts with a focus on recent advances in technology methods and improved results. IN PRESS This book is being published according to the Just Published model with more chapters to be published online as they are completed.

Resilient Hybrid Electronics for Extreme/Harsh Environments Amanda Schrand, Larry (L.J.) Richard Holmes, Eric MacDonald, 2024-06-06 The success of future innovative technology relies upon a community with a shared vision. Here we present an overview of the latest technological progress in the field of printed electronics for use in harsh or extreme environments. Each chapter unlocks scientific and engineering discoveries that will undoubtedly lead to progression from proof of concept to device creation. The main topics covered in this book include some of the most promising materials, methods, and the ability to integrate printed materials with commercial components to provide the basis for the next generation of electronics that are dubbed survivable in environments with high g forces, corrosion, vibration, and large temperature fluctuations. A wide variety of materials are discussed that contribute to robust hybrid electronics, including printable conductive composite inks, ceramics, and ceramic matrix composites, polymer-erived ceramics, thin metal films, elastomers, solders, and epoxies, to name a few. Collectively, these materials and associated components are used to construct conductive traces, interconnects, antennas, pressure sensors, temperature sensors, power-inducting devices, strain sensors, and gauges, soft actuators, supercapacitors, piezo ionic elements, resistors, waveguides, filters, electrodes, batteries, various detectors, monitoring devices, transducers, and RF systems, and graded dielectric or graded index GRIN structures. New designs that incorporate the electronics as embedded materials into channels, slots, and other methods to protect the electronics from the extreme elements of the operational environment are also envisioned to increase their survivability while remaining cognizant of the required frequency of replacement, reapplication, and integration of power sources. Lastly, the ability of printer manufacturers, software providers, and users to work together to build multi-axis, multi-material, and commercial off-the-shelf COTS integration into user-friendly systems will be a great advancement for the field of printed electronics. Therefore, the blueprint for manufacturing resilient hybrid electronics consists of novel designs that exploit the benefits of advances in additive manufacturing that are then efficiently paired with commercially available components to produce devices that exceed

known constraints As a primary example metals can be deposited onto polymers in a variety of ways including aerosol jetting microdispensing electroplating sintering vacuum deposition supersonic beam cluster deposition and plasma based techniques to name a few Taking these scientific discoveries and creatively combining them into robotic multi material factories of the future could be one shared aim of the printed electronics community toward survivable device creation
