## Earth's Interior Layers

### To review:

- The Earth is not entirely the same all the way throughout the inside of the planet. Instead, Earth is made up of distinct layers that have their own characteristics and composition. This means they are made of different materials and behave differently from one another.
- We can use seismic waves (shakes caused by tectonic activity) to Earth's layers. We can use these waves to look inside Earth's layers. Seismic waves travel through the Earth's layers to tell us what the inside of the Earth is like.
- There are three different types of crust:
  - Oceanic crust is horizontal under the oceans. It is thicker and more dense than continental crust. This means that it is cooler and denser than a continental plate. It will sink. It is pressure-cooked.
  - Continental crust is rounded on land. It is thicker and less dense than oceanic crust. This means that it is cooler and denser than a continental plate. It will "float" on the plates and get left off of it.
- Between these two crusts is the thickest layer of the Earth's interior, the mantle. This area is solid but behaves like a liquid due to being too hot and under pressure. There are two distinct parts of the mantle:
  - The upper mantle (asthenosphere) and the lower mantle.
- The asthenosphere and crust stick together – this is called the lithosphere. When we refer to tectonic plates, we are referring to the lithosphere.
- Plate movement is caused by convection currents in the lower mantle.

• The lower mantle, rock moves up and down. When it moves up, it will cool and
