Big Memory Systems Yu Hua, 2026-01-01 This book presents groundbreaking research schemes that are shaping the future of big memory systems. Large scale persistent and byte addressable memory eliminates traditional storage bottlenecks by unifying memory and storage hierarchies. For engineers and architects building next generation databases and distributed systems these innovations deliver transformative performance faster persistent writes through optimized flush mechanisms the reduced contention via lock free designs and high throughput using GPU acceleration. Each chapter presents fully implemented architectures in real world environments from learned indexes to RDMA powered transactions together with deployable code patterns and performance benchmarks. This book shows new devices are leveraging big memory to achieve low latency persistence hardware accelerated data processing and linear scalability in distributed environments. Designed for professionals with operating systems fundamentals this book bridges cutting edge research with practical implementation where big memory's unique characteristics persistence at DRAM speeds massive capacity and fine grained access demand fundamentally new architectural approaches. Learn how to achieve faster queries with learned indexes in the disaggregated memory how to optimize cuckoo hashing for persistent memory's asymmetric costs and why the latest GPUs incorporate these persistence techniques. This book also provides efficient and useful toolkits the RDMA protocols have been adopted in storage tiers while the lock free designs improve real time recommendation systems. Whether building cloud native databases low latency recommendation systems or memory driven AI services these solutions will help exploit the full potential of the big memory

Parallel Programming for Modern High Performance Computing Systems Paweł Czarnul, 2018-03-05 In view of the growing presence and popularity of multicore and manycore processors accelerators and coprocessors as well as clusters using such computing devices the development of efficient parallel applications has become a key challenge to be able to exploit the performance of such systems. This book covers the scope of parallel programming for modern high performance computing systems. It first discusses selected and popular state of the art computing devices and systems available today. These include multicore CPUs manycore co processors such as Intel Xeon Phi accelerators such as GPUs and clusters as well as programming models supported on these platforms. It next introduces parallelization through important programming paradigms such as master slave geometric Single Program Multiple Data SPMD and divide and conquer. The practical and useful elements of the most popular and important APIs for programming parallel HPC systems are discussed including MPI OpenMP Pthreads CUDA OpenCL and OpenACC. It also demonstrates through selected code listings how selected APIs can be used to implement important programming paradigms. Furthermore it shows how the codes can be

compiled and executed in a Linux environment The book also presents hybrid codes that integrate selected APIs for potentially multi level parallelization and utilization of heterogeneous resources and it shows how to use modern elements of these APIs Selected optimization techniques are also included such as overlapping communication and computations implemented using various APIs Features Discusses the popular and currently available computing devices and cluster systems Includes typical paradigms used in parallel programs Explores popular APIs for programming parallel applications Provides code templates that can be used for implementation of paradigms Provides hybrid code examples allowing multi level parallelization Covers the optimization of parallel programs
