

Fig. 1 Interprétation géométrique d'un système linéaire réel 2×2 . Les représentations graphiques des deux équations correspondent à des droites. Trois cas sont possibles : il n'y a pas de solution (les droites sont strictement parallèles, dessin de gauche), il y a une unique solution (les droites se coupent, dessin central), il y a une infinité de solutions (les droites sont confondues, dessin de droite).

la première équation par a_{22} , la seconde par $-a_{12}$ et on additionne le tout. De même, pour obtenir une équation ne portant que sur l'inconnue x_2 , on peut multiplier la première équation par $-a_{21}$, la seconde par a_{11} et on additionne le tout. On obtient alors le système suivant :

$$(S'_{2 \times 2}) \quad \begin{cases} (a_{11}a_{22} - a_{12}a_{21})x_1 &= b_1a_{22} - a_{12}b_2 \\ (a_{11}a_{22} - a_{12}a_{21})x_2 &= a_{11}b_2 - b_1a_{21} \end{cases}$$

La quantité réelle $a_{11}a_{22} - a_{12}a_{21}$ est présente en facteur dans les deux équations. On l'appelle le *déterminant du système 2×2* . Cette quantité joue un rôle capital. Discutons de sa valeur.

- Supposons $a_{11}a_{22} - a_{12}a_{21} \neq 0$. Le système linéaire $(S_{2 \times 2})$ possède alors une unique solution (on dit qu'il est déterminé). Notons-la $(\tilde{x}_1, \tilde{x}_2)$ où

$$\tilde{x}_1 = \frac{b_1a_{22} - a_{12}b_2}{a_{11}a_{22} - a_{12}a_{21}} \quad \text{et} \quad \tilde{x}_2 = \frac{a_{11}b_2 - b_1a_{21}}{a_{11}a_{22} - a_{12}a_{21}}.$$

On a donc : $\mathcal{S} = \{(\tilde{x}_1, \tilde{x}_2)\}$. D'un point de vue géométrique, cela signifie que les droites associées aux deux équations se coupent.

- Supposons maintenant $a_{11}a_{22} - a_{12}a_{21} = 0$. Alors le système $(S'_{2 \times 2})$ s'écrit

$$\begin{cases} 0 &= b_1a_{22} - a_{12}b_2 \\ 0 &= a_{11}b_2 - b_1a_{21} \end{cases}$$

Il est clair que si l'un (ou les deux à la fois) des deux scalaires $b_1a_{22} - a_{12}b_2$ et $a_{11}b_2 - b_1a_{21}$ est non nul alors ce système est absurde et, dans ce cas, il

Tude Analyse Quelques Mod Les Math Matiques:

Analysing the Structure of Economic Models J.P. Ancot, 2012-12-06 Understanding the structure of a large econometric model is rather like the art of winetasting or like the art of playing a musical instrument. The quality of a wine results from a complex combination of various elements such as its colour which should be clear and crystalline, its smell which can be decomposed into a general aroma and a variety of particular characteristics more or less persistent depending on the type and the age of the wine, its taste of course which again is a complex system whose equilibrium and charm depend on the whole set of ingredients: alcohol, tannin, glycerine, sugar, acidity. Similarly a clarinetist's musicianship depends on the quality of his instrument, on his embouchure, fingering, tonguing and articulation techniques, on his sense for rhythm, phasing and tone colour. However the enchantment produced by a Romanee Conti or by a brilliant performance of Brahms's F minor sonata for clarinet and piano arises from a process which is at the same time much simpler and much more complex than the straightforward juxtaposition of individual causal relations. In recent years econometricians and macro economists have been challenged by the problem of keeping abreast with an ever increasing number of increasingly more complex large econometric models. The necessity of developing systematic analytical tools to study the often implicit and hidden structure of these models has become more evident.

[Mathematical Tools for the Study of the Incompressible Navier-Stokes Equations and Related Models](#) Franck Boyer, Pierre Fabrie, 2012-11-06 The objective of this self contained book is two fold. First the reader is introduced to the modelling and mathematical analysis used in fluid mechanics especially concerning the Navier-Stokes equations which is the basic model for the flow of incompressible viscous fluids. Authors introduce mathematical tools so that the reader is able to use them for studying many other kinds of partial differential equations in particular nonlinear evolution problems. The background needed are basic results in calculus, integration and functional analysis. Some sections certainly contain more advanced topics than others. Nevertheless the authors aim is that graduate or PhD students as well as researchers who are not specialized in nonlinear analysis or in mathematical fluid mechanics can find a detailed introduction to this subject.

[Dynamic Modelling and Control of National Economies 1983](#) T. Basar, L. F. Pau, 2014-05-17 Dynamic Modelling and Control of National Economies 1983 contains the proceedings of the Fourth IFAC IFORS IIASA Conference and the 1983 SEDC Conference on Economic Dynamics and Control held at Washington D C USA on June 17-19 1983. Separating the 65 papers presented in the conference as chapters this book covers a broad class of problems or notions arising both in economic theory, control applications to planning and implementation issues. Some chapters discuss multi level interactions of government and private sectors in economic development, inflation and economic policy in an open economy, foreign debt and exchange rate stability in a developing country and expectations in numerical general equilibrium models. This book also explains a rational decision making process for resource policymaking, inference of the structure of economic reasoning from natural language analysis, modeling and analysis of a national economy and methodological issues in global
