**Advanced Digital Auditing** Egon Berghout, Rob Fijneman, Lennard Hendriks, Mona de Boer, Bert-Jan Butijn, 2022-10-29

This open access book discusses the most modern approach to auditing complex digital systems and technologies. It combines proven auditing approaches, advanced programming techniques, and complex application areas and covers the latest findings on theory and practice in this rapidly developing field. Especially for those who want to learn more about novel approaches to testing complex information systems and related technologies such as blockchain and self-learning systems, the book will be a valuable resource. It is aimed at students and practitioners who are interested in contemporary technology and managerial implications.

**Manuals of Food Quality Control** G. Miller, Food and Agriculture Organization of the United Nations, 1992-01-01. An important part of a national food control system is the capability for the analytical laboratory service to detect and quantify food contaminants such as residues of pesticide chemicals. This manual is a practical handbook on the analysis of foods for pesticide residue contamination. Its ultimate aim is to assure that a food control laboratory produces high quality analytical results using analytical methodology which has been shown to be reliable and reproducible for pesticide residue analyses. It includes discussions of sample handling techniques as well as many suggested analytical methods of choice to isolate qualitatively or quantitatively both pesticide chemical and industrial chemical contamination in food. The sample handling discussions cover the composition, preparation, extraction, clean up, and separation techniques for analysis of foods and varied matrices. The analytical methods are those for determination and confirmation of residues in foods. They are offered in an array which allows the determination of groups of like residues in broad multi-residue detection. Individual residue methods are suggested for singular residue needs.

Underwater Robots Junku Yuh, Tamaki Ura, George A. Bekey, 2012-12-06. All life came from sea but all robots were born on land. The vast majority of both industrial and mobile robots operate on land since the technology to allow them to operate in and under the ocean has only become available in recent years. A number of complex issues due to the unstructured hazardous undersea environment makes it difficult to travel in the ocean while today's technologies allow humans to land on the moon and robots to travel to Mars. Clearly the obstacles to allowing robots to operate in a saline aqueous and pressurized environment are formidable. Mobile robots operating on land work under nearly constant atmospheric pressure; their legs or wheels or tracks can operate on a firm footing; their bearings are not subjected to moisture and corrosion; they can use simple visual sensing and be observed by their creators working in simple environments. In contrast, consider the environment where undersea robots must operate. The pressure they are subjected to can be enormous, thus requiring extremely rugged designs. The deep oceans range between 19 000 to 36 000 ft. At a mere 33 foot depth, the pressure will be twice the normal one atmosphere pressure of 29.4 psi. The chemical environment of the sea is highly corrosive, thus requiring the use of special materials. Lubrication of moving parts in water is also difficult and may require special sealed waterproof joints.
