Targeted Learning **Targeted Learning:**

Targeted Learning in Data Science Mark J. van der Laan, Sherri Rose, 2018-03-28 This textbook for graduate students in statistics data science and public health deals with the practical challenges that come with big complex and dynamic data. It presents a scientific roadmap to translate real world data science applications into formal statistical estimation problems by using the general template of targeted maximum likelihood estimators. These targeted machine learning algorithms estimate quantities of interest while still providing valid inference. Targeted learning methods within data science are a critical component for solving scientific problems in the modern age. The techniques can answer complex questions including optimal rules for assigning treatment based on longitudinal data with time dependent confounding as well as other estimands in dependent data structures such as networks. Included in *Targeted Learning in Data Science* are demonstrations with software packages and real data sets that present a case that targeted learning is crucial for the next generation of statisticians and data scientists. This book is a sequel to the first textbook on machine learning for causal inference *Targeted Learning* published in 2011. Mark van der Laan PhD is Jiann Ping Hsu Karl E Peace Professor of Biostatistics and Statistics at UC Berkeley. His research interests include statistical methods in genomics, survival analysis, censored data, machine learning, semiparametric models, causal inference, and targeted learning. Dr van der Laan received the 2004 Mortimer Spiegelman Award, the 2005 Van Dantzig Award, the 2005 COPSS Snedecor Award, the 2005 COPSS Presidential Award, and has graduated over 40 PhD students in biostatistics and statistics. Sherri Rose PhD is Associate Professor of Health Care Policy Biostatistics at Harvard Medical School. Her work is centered on developing and integrating innovative statistical approaches to advance human health. Dr Rose's methodological research focuses on nonparametric machine learning for causal inference and prediction. She co-leads the Health Policy Data Science Lab and currently serves as an associate editor for the Journal of the American Statistical Association and Biostatistics.

Targeted Learning Mark J. van der Laan, Sherri Rose, 2011-06-17

The statistics profession is at a unique point in history. The need for valid statistical tools is greater than ever. Data sets are massive, often measuring hundreds of thousands of measurements for a single subject. The field is ready to move towards clear objective benchmarks under which tools can be evaluated. Targeted learning allows 1) the full generalization and utilization of cross-validation as an estimator selection tool so that the subjective choices made by humans are now made by the machine and 2) targeting the fitting of the probability distribution of the data toward the target parameter representing the scientific question of interest. This book is aimed at both statisticians and applied researchers interested in causal inference and general effect estimation for observational and experimental data. Part I is an accessible introduction to super learning and the targeted maximum likelihood estimator, including related concepts necessary to understand and apply these methods. Parts II-IX handle complex data structures and topics applied researchers will immediately recognize from their own research, including time-to-event outcomes, direct and indirect effects, positivity violations, case control studies, censored data,

longitudinal data and genomic studies **Computational Considerations for Targeted Learning** Jeremy Robert Coyle,2017 Targeted Learning represents a principled methodology that has the potential to leverage the availability of big datasets and large scale computing facilities However many of the methods are computationally demanding and therefore require careful consideration as to their implementation This thesis comprises three cases studies at the intersection between Targeted Learning and computation Chapter 1 describes the Targeted Bootstrap a novel bootstrap technique that samples from a TMLE distribution and therefore has asymptotic performance guarantees while avoiding issues related to cross validation on bootstrap samples Chapter 2 considers the problem of estimating both a target parameter and nuisance parameter on which it depends when ideally both would be estimated with cross validation By carefully considering what parts of the sample are used for what estimation tasks nested cross validation can be avoided at great computational savings This is achieved using the novel SplitSequential cross validation approach Chapter 3 describes the opttx package for learning optimal treatment rules This package contains an implementation of SplitSequential Super Learner and also contains a novel approach to learning an optimal rule for a categorical treatment variable Further performance based variable importance measures are used to evaluate which of the covariates are most useful for making treatment decisions

Multiagent Systems Yoav Shoham, Kevin Leyton-Brown, 2008-12-15 Multiagent systems combine multiple autonomous entities each having diverging interests or different information This overview of the field offers a computer science perspective but also draws on ideas from game theory economics operations research logic philosophy and linguistics It will serve as a reference for researchers in each of these fields and be used as a text for advanced undergraduate or graduate courses The authors emphasize foundations to create a broad and rigorous treatment of their subject with thorough presentations of distributed problem solving game theory multiagent communication and learning social choice mechanism design auctions cooperative game theory and modal logics of knowledge and belief For each topic basic concepts are introduced examples are given proofs of key results are offered and algorithmic considerations are examined An appendix covers background material in probability theory classical logic Markov decision processes and mathematical programming

Handbook of Big Data Peter Bühlmann, Petros Drineas, Michael Kane, Mark van der Laan, 2016-02-22 Handbook of Big Data provides a state of the art overview of the analysis of large scale datasets Featuring contributions from well known experts in statistics and computer science this handbook presents a carefully curated collection of techniques from both industry and academia Thus the text instills a working understanding of key statistical **Targeted Learning** Thomas E. This popular text gives students a comprehensive and readable introduction to contemporary issues in learning and behavior. The book's balanced coverage, careful organization and focus on animal learning have made it a favorite for years with professors and students alike. The book provides a systematic introduction to elementary forms of learning that have been the focus of research for much of the twentieth century: habituation, classical conditioning, instrumental conditioning, stimulus control, aversive control and their applications to the study of cognition and to the alleviation of behavior problems. Biological constraints on learning are integrated throughout the text as are applications boxes that relate animal research to human learning and behavior. The book is organized so that each chapter builds on the previous one and simpler phenomena (habituation and sensitization) are described before more complicated ones. Within each chapter, information is also presented in increasing order of complexity. Throughout analogies and examples help simplify and clarify concepts.
