Scientific and Technical Aerospace Reports ,1993 *Three Dimensional System Integration* Antonis Papanikolaou,Dimitrios Soudris,Riko Radojcic,2010-12-07 Three dimensional 3D integrated circuit IC stacking is the next big step in electronic system integration

It enables packing more functionality as well as integration of heterogeneous materials devices and signals in the same space volume This results in consumer electronics e g mobile handheld devices which can run more powerful applications such as full length movies and 3D games with longer battery life This technology is so promising that it is expected to be a mainstream technology a few years from now less than 10 15 years from its original conception To achieve this type of end product changes in the entire manufacturing and design process of electronic systems are taking place This book provides readers with an accessible tutorial on a broad range of topics essential to the non expert in 3D System Integration It is an invaluable resource for anybody in need of an overview of the 3D manufacturing and design chain *Wafer Level 3-D ICs Process Technology* Chuan Seng Tan, Ronald J. Gutmann, L. Rafael Reif, 2009-06-29

Three dimensional 3D integration is clearly the simplest answer to most of the semiconductor industry's vexing problems heterogeneous integration and reductions of power form factor delay and even cost Conceptually the power latency and form factor of a system with a fixed number of transistors all scale roughly linearly with the diameter of the smallest sphere enclosing frequently interacting devices This clearly provides the fundamental motivation behind 3D technologies which vertically stack several strata of device and interconnect layers with high vertical interconnectivity In addition the ability to vertically stack strata with divergent and even incompatible process flows provides for low cost and low parasitic integration of diverse technologies such as sensors energy scavengers nonvolatile memory dense memory fast memory processors and RF layers These capabilities coupled with today's trends of increasing levels of integrated functionality lower power smaller form factor increasingly divergent process flows and functional diversification would seem to make 3D technologies a natural choice for most of the semiconductor industry Since the concept of vertical integration of different strata has been around for over 20 years why aren't vertically stacked strata endemic to the semiconductor industry The simple answer to this question is that in the past the 3D advantages while interesting were not necessary due to the tremendous opportunities offered by geometric scaling In addition even when the global interconnect problem of high performance single core processors seemed insurmountable without innovations such as 3D alternative architectural solutions such as multicores could effectively delay but not eliminate the need for 3D *IBM Journal of Research and Development*, 2006
