GPU Parallel Program Development Using CUDA Tolga Soyata, 2018-01-19 GPU Parallel Program Development using CUDA teaches GPU programming by showing the differences among different families of GPUs. This approach prepares the reader for the next generation and future generations of GPUs. The book emphasizes concepts that will remain relevant for a long time rather than concepts that are platform specific. At the same time the book also provides platform dependent explanations that are as valuable as generalized GPU concepts. The book consists of three separate parts. It starts by explaining parallelism using CPU multi threading in Part I. A few simple programs are used to demonstrate the concept of dividing a large task into multiple parallel sub tasks and mapping them to CPU threads. Multiple ways of parallelizing the same task are analyzed and their pros cons are studied in terms of both core and memory operation. Part II of the book introduces GPU massive parallelism. The same programs are parallelized on multiple Nvidia GPU platforms and the same performance analysis is repeated. Because the core and memory structures of CPUs and GPUs are different the results differ in interesting ways. The end goal is to make programmers aware of all the good ideas as well as the bad ideas so readers can apply the good ideas and avoid the bad ideas in their own programs. Part III of the book provides pointer for readers who want to expand their horizons. It provides a brief introduction to popular CUDA libraries such as cuBLAS, cuFFT, NPP and Thrust, the OpenCL programming language, an overview of GPU programming using other programming languages and API libraries such as Python, OpenCV, OpenGL and Apple's Swift and Metal and the deep learning library cuDNN.

Hands-On GPU Computing with Python Avimanyu Bandyopadhyay, 2019-05-14 Explore GPU enabled programmable environment for machine learning, scientific applications and gaming using PuCUDA, PyOpenGL and Anaconda Accelerate. Key Features: Understand effective synchronization strategies for faster processing using GPUs. Write parallel processing scripts with PyCuda and PyOpenCL. Learn to use the CUDA libraries like CuDNN for deep learning on GPUs. Book Description: GPUs are proving to be excellent general purpose parallel computing solutions for high performance tasks such as deep learning and scientific computing. This book will be your guide to getting started with GPU computing. It will start with introducing GPU computing and explain the architecture and programming models for GPUs. You will learn by example how to perform GPU programming with Python and you'll look at using integrations such as PyCUDA, PyOpenCL, CuPy and Numba with Anaconda for various tasks such as machine learning and data mining. Going further you will get to grips with GPU work flows management and deployment using modern containerization solutions. Toward the end of the book you will get familiar with the principles of distributed computing for training machine learning models and enhancing efficiency and performance. By the end of this book you will be able to set up a GPU ecosystem for running complex applications and data models that demand great processing capabilities and be able to efficiently manage memory to compute your application effectively and quickly. What you will learn: Utilize Python libraries and frameworks for GPU acceleration. Set up a GPU enabled programmable

creation Attempts have been made to achieve real time framerates using PC cluster systems While these provide enough performance they are also expensive and less flexible Approaches that use GPU hardware acceleration on single workstations achieve interactive framerates for novel view synthesis but do not provide an explicit volumetric representation of the whole scene The proposed approach shows the efforts in developing a GPU hardware accelerated framework for obtaining the volumetric photo hull of a dynamic 3D scene as seen from multiple calibrated cameras High performance is achieved by employing a shape from silhouette technique in advance to obtain a tight initial volume for Space Carving Also several speed up techniques are presented to increase efficiency Since the entire processing is done on a single PC the framework can be applied to mobile setups enabling a wide range of further applications The approach is explained using programmable vertex and fragment processors with current hardware and compared to highly optimized CPU implementations It is shown that the new approach can outperform the latter by more than one magnitude The downloadable introduction has been written specifically for this offer Its contents are only a subset of the real introductory chapter of the thesis [The Cg Tutorial](#) Randima Fernando, Mark J.
