Spectral Analysis And Filter Theory In Applied Geophysics:

Spectral Analysis and Filter Theory in Applied Geophysics Burkhard Buttkus, 2000-03-27 This state of the art survey serves as a complete overview of the subject Besides the principles and theoretical foundations emphasis is laid on practical applicability describing not only classical methods but also modern developments and their applications Students researchers and practitioners especially in the fields of data registration treatment and evaluation will find this a wealth of information

Advanced Digital Signal Processing of Seismic Data Wail A. Mousa, 2020-01-16 Seismic data must be interpreted using digital signal processing techniques in order to create accurate representations of petroleum reservoirs and the interior structure of the Earth This book provides an advanced overview of digital signal processing DSP and its applications to exploration seismology using real world examples The book begins by introducing seismic theory describing how to identify seismic events in terms of signals and noise and how to convert seismic data into the language of DSP Deterministic DSP is then covered together with non conventional sampling techniques The final part covers statistical seismic signal processing via Wiener optimum filtering deconvolution linear prediction filtering and seismic wavelet processing With over sixty end of chapter exercises seismic data sets and data processing MATLAB codes included this is an ideal resource for electrical engineering students unfamiliar with seismic data and for Earth Scientists and petroleum professionals interested in DSP techniques

GPS Stochastic Modelling Xiaoguang Luo, 2013-07-06 Global Navigation Satellite Systems GNSS such as GPS have become an efficient reliable and standard tool for a wide range of applications However when processing GNSS data the stochastic model characterising the precision of observations and the correlations between them is usually simplified and incomplete leading to overly optimistic accuracy estimates This work extends the stochastic model using signal to noise ratio SNR measurements and time series analysis of observation residuals The proposed SNR based observation weighting model significantly improves the results of GPS data analysis while the temporal correlation of GPS observation noise can be efficiently described by means of autoregressive moving average ARMA processes Furthermore this work includes an up to date overview of the GNSS error effects and a comprehensive description of various mathematical methods

Multirate Statistical Signal Processing Omid S. Jahromi, 2007-05-15 The eld of multirate signal processing has witnessed a great deal of progress and an increasingly wide range of applications since the publication of the rst textbook by Crochiere and Rabiner 1983 However this progress has been mainly in the area of deterministic systems with emphasis on perfe reconstruction and or orthogonal systems This book introduces a statistical theory for extracting information from signals that have di erent sampling rates This new theory generalizes the conventional deterministic theory of multirate systems beyond many of its constraints Furthermore it allows for the formulation of several new problems such as spectrum estimation time delay estimation and sensor fusion in the realm of multirate signal processing I have arrived at the theory presented here by integrating concepts from diverse areas such as information theory inverse problems and theory of

equalities The process of merging a variety of concepts of different origin results in both merits and shortcomings The former include the fresh and differentiated view of an amateur providing scope of application The latter include a lack of in depth experience in each of the original fields Granted this may lead to gaps in continuity however it goes without saying that a complete theory can seldom be achieved by one person and in a short time My goal in writing this book has been to inspire the reader to initiate his own research and add to the theory of multirate statistical signal processing

Stochastic Models for Geodesy and Geoinformation Science Frank Neitzel, 2021-02-12 In geodesy and geoinformation science as well as in many other technical disciplines it is often not possible to directly determine the desired target quantities Therefore the unknown parameters must be linked with the measured values by a mathematical model which consists of the functional and the stochastic models The functional model describes the geometrical physical relationship between the measurements and the unknown parameters This relationship is sufficiently well known for most applications With regard to the stochastic model two problem domains of fundamental importance arise 1 How can stochastic models be set up as realistically as possible for the various geodetic observation methods and sensor systems 2 How can the stochastic information be adequately considered in appropriate least squares adjustment models Further questions include the interpretation of the stochastic properties of the computed target values with regard to precision and reliability and the use of the results for the detection of outliers in the input data measurements In this Special Issue current research results on these general questions are presented in ten peer reviewed articles The basic findings can be applied to all technical scientific fields where measurements are used for the determination of parameters to describe geometric or physical phenomena
