Designing Human Interface in Speech Technology Fang

Chen, 2006-03-06 Designing Human Interface in Speech Technology bridges a gap between the needs of the technical engineer and cognitive researchers working in the multidisciplinary area of speech technology applications. The approach is systematic and the focus is on the utility of developing and designing speech related products. Included is coverage of topics such as neuroscience on the multimodal cortex, cognitive theories on multi task performance, stress and workload as well as human information process theory and ecological interface design theory for evaluating speech related human system interfaces. Of special emphasis are topics such as spoken dialogue system design in vehicle communication system design and speech technology in military applications. Also included are tools on how to analyze the design different design theories and process methods about how to understand users. The material systematically describes the user center design process and usability evaluation methods. Designing Human Interface in Speech Technology is appropriate for designers, engineers and decision makers working in the area of speech technology research. It is also a good text book for senior university students and postgraduate students in the respective interaction design areas.

Mathematical Models for Speech Technology

Stephen Levinson, 2005-05-13 Mathematical Models of Spoken Language presents the motivations for intuitions behind and basic mathematical models of natural spoken language communication. A comprehensive overview is given of all aspects of the problem from the physics of speech production through the hierarchy of linguistic structure and ending with some observations on language and mind. The author comprehensively explores the argument that these modern technologies are actually the most extensive compilations of linguistic knowledge available. Throughout the book the emphasis is on placing all the material in a mathematically coherent and computationally tractable framework that captures linguistic structure. It presents material that appears nowhere else and gives a unification of formalisms and perspectives used by linguists and engineers. Its unique features include a coherent nomenclature that emphasizes the deep connections amongst the diverse mathematical models and explores the methods by means of which they capture linguistic structure. This contrasts with some of the superficial similarities described in the existing literature the historical background and origins of the theories and models the connections to related disciplines e.g. artificial intelligence, automata theory and information theory an elucidation of the current debates and their intellectual origins many important little known results and some original proofs of fundamental results e.g. a geometric interpretation of parameter estimation techniques for stochastic models and finally the author's own unique perspectives on the future of this discipline. There is a vast literature on Speech Recognition and Synthesis however this book is unlike any other in the field. Although it appears to be a rapidly advancing field the fundamentals have not changed in decades. Most of the results are presented in journals from which it is difficult to integrate and evaluate all of these recent ideas. Some of the fundamentals have been collected into textbooks which give detailed descriptions of the techniques but no motivation or perspective. The linguistic texts are mostly descriptive and pictorial.

lacking the mathematical and computational aspects This book strikes a useful balance by covering a wide range of ideas in a common framework It provides all the basic algorithms and computational techniques and an analysis and perspective which allows one to intelligently read the latest literature and understand state of the art techniques as they evolve
