

Investigation 4A

TEMPERATURE AND AIR MASS ADVECTION

Objectives

Land surfaces and atmosphere are unevenly heated by solar radiation, thus producing a great flow between masses, some moving from hot to cold, then from cold to hot, or in any other direction. High latitudes experience more outgoing than incoming radiation. These energy imbalances and deficits are balanced by horizontal movements of air and absorption of heat energy produced by incoming air masses, storm circulation, and ocean currents. The transport of air from regions of relatively high temperatures to a region of lower temperatures is a climatological feature. The weather referred to as warm air advection. Conversely, the transport of air from regions of relatively low temperatures to a region of higher temperatures in the wind is called cold air advection. Identification of areas of warm and cold air advection requires an ability to determine if and how, directionally, the air temperature pattern made possible through the drawing of isotherms.

After completing this investigation, you should be able to:

- Draw lines of equal temperature (isotherms) to reveal the pattern of air temperatures across the entire map area.
- Locate regions on a weather map where cold and warm air advection is occurring.
- Relate warm and cold air advection patterns to circulation of weather systems.

Introduction

Temperature patterns are found on weather maps by drawing lines representing specific temperatures. These lines are called isotherms because they join on the same line the same temperature value. The skills required to draw isotherms are much the same as those needed to draw isobars.

Tips on Drawing Isotherms

- Always draw an isotherm so that temperatures higher than its value are consistently to one side and lower temperatures are to the other side.
- Assume a steady temperature change between neighboring stations when plotting an isotherm that is not intermediate to their isotherms.
- Adjacent isotherms tend to bow either. The isotherm you are drawing will always dip in a general way with the curves of its neighbor because change in air temperature from place to place are usually (but not always) gradual.
- Continue drawing an isotherm until it reaches the boundaries of plotted data or "close" values that indicate the working is too far to the other side and completing a loop.
- Isotherms can never be open ended within a data field and they never form loops or cross one another.
- Isotherms cannot be dropped if their values fall within the range of temperatures reported on the map. Isotherms must always appear in sequence. For example, where an observed isotherm is 10 degrees, then another a 50 ° Fahrenheit isotherm (or 10 °) and (or 50 °) isotherms.
- Always label isotherms.

Figure 1 Display temperature values reported at the same time across a portion of the US. Print a copy of the map for analysis by clicking on the figure or going to the Learning Files section of the RealTime Weather Portal and clicking on the "Investigations Manual Images" link. Proceed to the investigation ([Figure 1](#)) by going to the one labeled "3A" selecting "Fig. 1" and then printing the figure. The map reports shows temperatures in degrees Fahrenheit (°F) at various weather stations. Consider each temperature value to be located at the center of its plotted location. The 10 °F isotherm and one or 50 ° have been drawn and labeled. Draw the remaining 20, 30, 40, 50 and 60 °F isotherms needed. Be sure to label each isotherm at both ends or, if encircling an area, at a break in the line.
